Sounds like you need to change the SCSI ID # on the Megafile - they are all ID #0 from the factory. I've never done this, but it seems to me that I read a post here long ago that said there was a small panel on the case that you could open up to get at the ID changing thingies (dip switches?).

I have a Megafile 30 here (noisy, isn't it :-), so I could try to find it, if that would help.

That would be the easiest approach, but Halvaard (and others) would prefer another solution. Unfortunately the only other way I know is the Dallas DS1216E module (I think that's the right number) which plugs in under a TOS ROM chip. That won't fit inside some ST's (PSU fits over the top).

>RTC chips...

The project I refer to already has the necessary programs, however I couldn't get the clock to start! Look on UTSI for the archive under "Hardware).

I got the clock chip as a free sample from Dallas Semiconductors' UK distributers.

>servers (fe. relay.ping.be & news.ping.be)

I understand, the reason for my question was that I had used the get_ip
utility to get the numbers to plug in, the next day I went back to check
something else and those numbers had changed!

If one didn't use Fiffi or the Emailer then one might never know that there
was a problem here! :-/

>In the menu item "Services" the rubber stamp and key symbols entries are used to

OK, I understand.

>In the menu item "Proxies" you may enter the proxies of your ISP, experimentation
>should be done here, sometimes its faster without the proxy.....

Understood (I'm all for speed!) :-))

>If You do use a proxy, don't forget to enter something like *.ping.be in the menu
>item "don't use for".

I understand that you're using a wildcard along with the example ISP you've
used, but I don't know the reasoning behind these entries. Something to do
with not using the proxy for browsing web pages hosted on one's own ISP?
Perhaps this is to force CAB to reload that specified site rather than use
the proxy's cached version?

>Switch on the "Pro" box and experiment with the maximum transmission unit in the
>"IP" menu item. Standard it is set to 564 but this value may be different according
>to the ISP you use. I get the best values when set to 1650....

I guess that I'd be wasting my time asking them! :-))

>When IConnect is "tuned", it leaves STING far behind, running CAB under IConnect
>gives me speeds up to 1000cps more. You will notice also a difference in speed when
>sending and receiving mail and newgroups under ASH Emailer. Oh yes, and FIFI will

>fly !!!

Thanks for the config suggestions. I'm right with you over its speed, IConnect even seems to take less time to get me logged in than STinG (to make a fair test of that statement I'd have to make sure that all settings were the same between the two).

>I think IConnect has got much more power and possibilities, but because of the

Quite right. Starting with the ability to open connections to several FTP servers at once!

Fiffi does disappoint a little tho', as there is no way to enter the same server but with a different starting directory in the hotlist. Perhaps I can copy and paste hotlist entries in a text editor, I haven't tried this yet.

>CAB.OVL and the "lousy" documentation it has got a reputation witch it doesn't
>deserve.....

Agreed - in the case of IConnect the docs seem to be wrong or misleading at best, along with some omissions!

Do you mean that it writes its progress messages outside of the box?

I did notice that Fiffi would write error messages about sockets down the screen when I started playing about with it - something that stops once properly installed.

We never had that version in the UK, the importers said that they would wait
for the next update (and we're still waiting...)

But I digress - didn't I read that Kobold would switch to GEMDOS mode for
copying LFN's, which would negate its speed advantage?

It has a new desktop, you can place program icons on the desktop. It handles drag'n'drop to these icons too. You can set your own icons. plus some other stuff. TOS 2.06 also handles IDE drives and various strange memory configurations, so if you plan on fitting an IDE drive or more than 4Mb RAM on an ST(E), it's a must.

I don't think it really takes up 200K. Maybe something like 50K for buffers or internal stuff, but that's probably it.

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I am need help with formatting my 850MB for the falcon. I have been looking on site for a good hard drive formatter for the falcon. I trying to upgrade my falcon to a 850MB from 60MB. But now i am unable to read the 60MB HD? Why is there a program that can help me recover the HD. Some told me that all need to do is just put the drive in and should be seen by tos, But that's wrong. I need to find a program to format and see the IDE drive. I hope some can post or e- mail me a mobie@yhaoo.com and help. I need to try and get an answer this today or this weekend Maurice.

I can assure you, CAB handles long names for both folders and files.
One thing it _doesn't_ handle (depending on the CAB.OVL, actually) is
spaces in folder or file names.

>By truncated file names, I'm referring to MS's way of handling long
>file name in older machines, where dummynumber1.xxx and
>dummynumber2.xxx become dummyn~1.xxx and dummyn~2.xxx when displayed

I still don't understand what this has to do with CAB. Are you
saying the truncated names are up on the site? If so, I don't see
why CAB wouldn't treat them as anything other than a normal filename.

Started up 1040 2.06 without harddisc, even without floppy.
Its right on my screen.
Options --> Desktop configuration: System free memory: 808374 bytes.

Needless to say I a was quite a bit disappointed than.
Anybody who had already 2 or 4 K probably didnt notice or care.

Henk.

1874. Burning code into GAL ... help ...

Newsgroup: comp.sys.atari.st

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi !

I need some technical help, is there anybody here able to burn some
code in a GAL chip ?
I have the code to burn but not the GAL itself, it's a "20V8" model.

Please, could you contact me for further help ?

Thanks for any help

Well, the file that I would generate in .WAV format would be too big. My requirements aren't for a few seconds or minutes of audio. I'm talking 20-30 minutes. The resulting .WAV file would be too big to easily download, even if it were compressed.

Hi Clayton,

I think I've made a mess of this, so let me clear it up.

I should not have responded to you on,my friends computer.
that's where that abrilane@ibl.bm comes from.

I've moved into a new apt.,and I was checking my e-mail there.
I use a Hotmail address,so that I can check my e-mails
on other systems through their web page.

My correct address is escaisey@ibl.bm.

Please resend the Logic Audio program to this address instead.
* I can never get attachments out of Hotmail.

My friend deleted the Logic.Prg out of his e-mail program.He did not
know what it was.

I'm happy that someone else confirmed this problem with the Logic
User's site.

I do not have an FTP program,I've been using Internet Explorer on the
PC to access this site.

In the past I always went to the ftp site for the programs, and never
had any problems.Maybe I should try in the early morning hours like
you do.

How about going to the site again and sending me the link from there.
I tried this getting on again this morning,this time it came up as a
bad address.

thanks again.

Hey John, did you ever get the XOR profile for the Alesis DM 5 module?
I can use one of those now.I remember sending some e-mails to you
about 2years ago.

Oops..... :-}}

I hope you enjoyed the GEMtrade version of WINX.INF - maybe I should send
it to the Campaign for Plain English :-)))

Anyway, it was Martin Byttebier who found the fix for me in WINX.INF.
I've pasted a bit of it below so that you can identify where to put
it...

# unter dem gefunden Eintrag nicht definiert sind.

> > > > > > > > > > > > > > > >

You will see I've done the same for Okami, as I had the same error
messages when I started to use that.

I tried to run without WINX for a while and always crashed on boot-up. I
eventually tracked this down to HA_ESCC.PRG which I replaced with SCC.PRG
(thanks again to Martin for the suggestion) and this seems to work fine,
no difficulty now using WINX or not depending on what I am doing.
(Cubase doesn't like WINX.)

It sometimes happens that the icon window is in the foreground, and the
application window is just behind. You can either double-click on the
icon you want for this program or push the window to the background.

Hope this helps

I myself do not doubt that contrary to promises N.AES does not work
well with nonprop fonts.
As I already said: the Atari font is ok for me and to keep on the
safe side I use nothing else.
But when you want to walk on the wild side..... {:-)

>
>Meanwhile I am trying to work Mint/n.AES for a while to see what it's all
>about.

And I would say: do not hurry. To get a well-founded opinion about an
oparating system is a time consuming and sometimes joyless task.

But then: from your messages I understand that you like wrestling
with your Atari.

Have you read the article about MiNT98 in the last issue of the ST
magazine (Dutch)? Then you know that you are certainly not the only
soul blowing on the winds of change.

For myself: first MiNt gave me the creeping crawlies.
But after installing N.AES I have calmed down. Bit by bit I took more
tasks to that setup and now I only very seldom go to Single TOS and
then only because I have to.
I agree, it took me a while to build it up...

>
>Nope, this article will be that of an unprejudiced (can one ever be?) user

maybe, I can ask for a special 'review' N.AES for you. In the past
firms were sometimes glad to give them free for getting some
publicity. But sometimes that was difficult because the magazine
was to 'independent'.

See the other answers. But for floppy disks:
normally there is room in the root voor 112 places. (Correct me
if I am wrong)
When you use FcopyPro for formatting there is a 'number of folders'
you can set. I think that then some more sectors are reserved for the
tables.

Did I totally miss something or did I hear incorrectly? Wasn't someone going to port Micq to work with Sting? Since I don't use Mint (and it doesn't look like I'll be using it any time soon, I'm afraid) I'd really appreciate the port! I heard a rumor at one point that someone was working on it, but haven't heard anything since. I'd love to see it, though, since I'm pretty much the only one in my family who isn't on ICQ (since I'm the only one in my family who uses an Atari instead of a PC). PLEASE tell me someone is working on it!!!!!! If not, someone PLEASE do!!!!!!!!!

From: Chiasson-Tollefsen <alia@nbnet.nb.ca>
Message-ID: <36B25E30.F82AFD1@nbnet.nb.ca>
Source record: 85344

My SLM605 make a loud noise when first turned on and then calms down. If I do a print the noise comes back as it powers up, the paper advances about 4 inches into the printer and then the printer reports a paper jam. I remove the basket and there is nothing obstructing the paper. Oddly, once the printer has warmed up or if I reset the basket (drum and toner) the noise goes away and it prints just fine. Any ideas on the cause of the problem? I just had the printer cleaned not that long ago.

Thanks

Alyre Chiasson

Hi Dorian!

> M-E> The 0.54 package found on ftp.funet.fi (among other sites) is the
> M-E> last one that works correctly for me.

Actually, this is no longer the case. The new Linux port now works well!
;-)

However, if you run NFSD and MOUNTD from /etc/rc.net you will have to
remove the "-f /etc/xtab" that forces that file upon the daemons, because
the new ports always look for their config in /etc/exports and the format
is completely different from /etc/xtab!

However, you will still need the client (nfs.xfs from 0.54) to access
the daemons. Also, make sure you use mount_nfs, because we don't yet
have a complete 'mount' command that covers both local and networked
filesystems, and mount everything inside /nfs. For example:

mount_nfs hostname:/path/to/dir /nfs/dir

Obviously, you'll need to ensure that the dir you want to export
is properly configured in /etc/exports but this is nothing a MAN
can't handle! ;-))) (pun intended!)

> system... I think it's a portmapper problem as it's killed at boot up
> time as soon as nfsd or mountd are launched. Weird. Is there a more
> recent version of portmap since the one released in the kgmd?
> Is there any doc or man for portmap?

MAN rpc if I remember.

A root directory normally has a fixed amount of space to store file names.
For most versions of TOS it is 256 files. Subdirectories, however, are
created at the user's request and can "string" themselves together
transparently. Consequently, they have no limit.

Even the biggest drive will fill if its root directory reaches 256 files.
Create but a single folder and you can put files into the folder to your
heart's content.

> I do. I've tried modifying the mint.cnf but all I get is a permission
> denied message.
>

I had the same problem when trying to install KGMD on my Hades. In the end I installed it on my Falcon and copied it accross. I have heard (I think on the MiNT mailing list) that there is a new version of the ramdisk. Perhaps you should try using the new version to see it it is any better.

Regards,

Ben Hills.

None.With reduncancy I meant: 2 computers: 1 with, and 1 without internet.
So you must ask MABN for details.
In fact A2000 doesnt like you to have 2 computers on 1 connection.

Henk.

Hi Sean,

Here we go again. I gave you the address where you can get LOGIC 2.01 and LOGIC AUDIO 2.01 .PRG files, but you can't seem to find them. They are there, I've looked several times. Then, I emailed LOGIC AUDIO 2.01 to you on 26-Jan, but I have not heard back from you. Did my emails not get thru to you? I sent them to abrilane@ibl.bm. If you need, I can give it another try.

I checked the ftp site a few days ago - it's still there. As far as I know, it's always been there with the same files for at least 2 years. That's where I got Logic Audio 2.01. It doesn't make sense that I can get through to the Atari files, but you can't find any Atari files. Have you typed everything EXACTLY like I have it? With the CAPS and different catagories? This site has no connection with the Emagic company, as far as I know.

dir.mcc.ac.uk/pub/emagic/LOGIC/UPDATES/ATARI

Make sure the first part is "dir", NOT "ftp". In fact, "ftp" and "music" should never be part of that address. You can try just going to the root directory to start with, then work your way up through the catagories.

The other site is useless. Don't go there:

ftp.mcc.ac.uk/pub/music/emagic/LOGIC.... is NOT the place to go. Also, as you've already found out, the Emagic web site is of no use.

Just trying to help,

Clayton Murray

This already might have been mentioned, but HD Driver has the option
to increase the number of files in a root directory before
partitioning a disk. I haven't used the feature, and prefer folders,
but it is there.

As far as I know, it was played on one ST. Possibly this was just a demo
version of MidiMaze, since it was given away on a cover floppy.

That's maybe so but the latest Mint kernel and MagiC supports this without
any hassle. Thing 1.27 and Jinnee desktop supports this also.

Unfortunately most prog's doesn't support this, e.g. Graftool, Gemview,
1st Guide.
OTOH prg's like Freedom 2.5, Calamus SL98, Qed 4.52, Everest 3.6, Smurf
1.5 and Image Copy 4.2b2 Plus can handle file names with spaces.

You surely can ask question or tell others what you're experiencing. Maybe
it's because my English is far from perfect and beeing so misinterpret
your sayings but for me it looked like you wanted to put N.AES into
discredit. If not, my apology.

> Weeks later I discover

That's why David Bolt made the excellent utility for converting
spaces in filenames to underscores, e.g. "long filename" to
"long_filename".

(Available at my web site below.)

>them. When they came on, all I could get them to do was beep when I
pressed
>a keyboard key. There was a mouse cursor on the screen, but I don't have
>any ST mice.

Of course, without a mouse you won't go very far. You need a mouse of some sort, so the first thing to do is either buy an ST mouse, get a PC mouse with the serial driver as provided in the Quick FAQ, or get one of the serial mouse adapters. In the meantime, use the Alt+Arrow combination.

Most software can be found on FTP sites such as ftp.lip6.fr, ftp.uni-paderborn.de, ftp.funet.fi, etc... Commercial stuff, you will have to buy. Just copy the files over with double-density 720K DOS formatted disks.

1922. Syquest 270 Meg removable

Newsgroup: comp.sys.atari.st
Date: 1999-01-30 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <t7Ms2.5232$r%4.10560@news21.bellglobal.com>
Source record: 85205

I purchased a 270meg removable drive with my Falcon. I have no manual for the syquest. At first they couldn't read the atari files on them, so I formatted both cartridges. After using one cartridge about 5 times over six months, I noticed that one partition was acting up. Sure enough it has 180 bad sectors and can no longer be formatted with hd driver 6. It still works but I wouldn't trust it so I am going to set it aside.

Now, I figure that I have caused this damage and therefore don't want to corrupt the remaining cartridge that I have.

1) Do you leave a cartridge in the syquest when it is off? (I have been)
2) Do you eject the cartridge first, then shut down?
3) Do you start up the syquest empty, insert a cartridge then turn on your computer?
4) Should there always be a cartridge in the drive unit?

Does anyone know if bad sectors can be fixed?
Has anyone ever returned a cartridge? Mine has a 5 year guarrantee, only I have no idea how old these cartridges are:-).

I want to get my falcon on the internet soon, and was hoping to run the software off the syquests vs the internal IDE.

Thanks Brian.

1923. Magic4 , NVDI4, TOS 1.0 and SH204

Newsgroup: comp.sys.atari.st
Date: 1999-01-30 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <x7Ms2.5233$r%4.10560@news21.bellglobal.com>
Source record: 85206

Greetings.

I am about to offer some of my findings to all readers who can then hopefully tell my why this occurs.

1) Magic would install but not run on SH204 formatted with SH204format.
2) Magic would install and run on SH204 formatted with adhi version 3.0 (1989)

3) SH204 will only AUTOBOOT from floppy of SH204software and never adhi3.0.
4) Drive C has adhi3.0 bootstrap installed.
If there is a problem on the drive and I have to boot off floppy to modify auto programs or if bootsector is destroyed only the 204 software recognised the drive. Even hd driver will not reconise the SH204 until after I have booted from the SH204 software. I can then format with anysoftware. Otherwise the hard drive does not exist.

5)NVDI wouldnot install on the ST with TOS 1.0 running.
6)NVDI would install on my ST with Magic Successfully installed.

7)NVDI crashes when running on TOS 1.0 (nothing else on loaded or on drive)
8)NVDI works under Magic.

Finally, I just want to say that the speed and flexibility of NVDI and Magic are very cool. It appears faster on my ST than my Falcon with Geneva and Warp 9 and Speedo GDOS (I prefer this setup for the falcon).

Unfortuneately, Magic has proven to be far from stable crashing at random in an unpredictable manner.
CAB 1.5 crashes frequently and becomes lost when in Magic. Yet works fine in my TOS 1.0 mode.
NEWsie works verywell in Magic, and this version .94 works well in TOS 1.0.

What I would like is to be able to use NVDI in TOS 1.0?
Any IDEAS to any of the above would be welcome.

Message-ID: <B7Ms2.5235$r%4.10560@news21.bellglobal.com>
Source record: 85208

Can someone tell me a little about this program. It came with my falcon, doesn't appear to be installed and unfortunetly the box only has one disk, and the manual says there is too. I just looked at SFT webpage and saw that this prg sells for roughly $139US. The original disk is still in original condition uninstalled. It looks pretty cool, glancing through the manual. I would be interested in obtaining the second disk.

1926. Speedo GDOS

Newsgroup: comp.sys.atari.st
Date: 1999-01-30 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <E7Ms2.5236$r%4.10560@news21.bellglobal.com>
Source record: 85209

The Falcon came with Speedo Gdos. The previous owner also updated Speedo with Compos version 5. I want to install speedo GDOS on my ST but all the disks are in 1.44. The program installs automatically and I would like to know if anyone knows how to break the files up to get them onto 720k disks so that it can be installed without errors. However if someone knows how to manually install everything, I would be happy to do this too. I tried a few ways with bad luck:-(.

1927. Magic SHUTDOWN !!!ARGH!!!

Newsgroup: comp.sys.atari.st
Date: 1999-01-30 00:00:00 UTC

Message-ID: <G7Ms2.5237$r%4.10560@news21.bellglobal.com>
Source record: 85210

I am trying to shutdown Magic and it continues to advise me that I have a prg running that must be quit. Now I must admit I was playing Chessmaster while waiting to connect onto the internet. However the prg is not running and was quit, yet magic asks for me to quit this program. I have since shut the computer off for a period of time and still cannot use the shutdown feature. Not only that, but Chessmaster will not load because magic thinks it is loaded.

Well, what have I done:-).

For a start you can operate the mouse from the keyboard! Keep
[Alternate] down and move the mouse arrow with the arrow buttons. By
holding down [Shift] as well it's possible to move pixel by pixel.
[Alternate]+[Insert] simulates left mouse button and
[Alternate]+[ClrHome] the right. Note that [Alternate]+[Help] will try
to print the screen! If no printer is connected everything will freeze
for about 30 sec before it times out.

From: jimcoile@nwlink.com
Message-ID: <36b3b58a@news.nwlink.com>
Source record: 85214

Hi all,

This may already have been covered, but I just installed the update to NVDI 5 from ver 4.12. I'm currently only able to print via the "background" method as when I try to access the NVDIPRN CPX, I get a dialog stating "AES call 200 not implemented". Is this a familiar problem to anyone? I'm using Magic 5.11 and will be upgrading to ver 6 as soon as it arrives so I'm not able to currently able to reinstall Magic. (sent the discs in for the upgrade) Any help would be greatly appreciated.

Thank you,

Ronald,

appearently some people never "understand"... I've seen lotsa files with
spaces on the Net, especially piccies. For one thing, TOS never allowed
you to use spaces, I haven't checked this with other systems. But long ago
I created a filename with a ? in it (really don't recall how, but
nevermind) and the next thing was a bunch of hell after I tried to load it
again.
In the end Diamond Edge changed the filename into something legal :-)
Now I know that ? and * characters are strictly forbidden/unwanted, but
since then I rename every file with !, # and ~ characters as well.

I'll bet it is trying to write to the maintenance track, which may
give you messages like 'does not support scsi command blahdeeblah'.
You _should_ be able to write the bad sectors to the FATs - there
should be an option for this (well, I know that the ICD/Diamond Edge
combination that I use will, somewhere in the prgs.)

Obviously, I am not expert at these things. But I have made some
recalcitrant drives work, using these prgs and techniques.

Martin submitted;

>>When IConnect is "tuned", it leaves STING far behind, running CAB under IConnect
>>gives me speeds up to 1000cps more.

I formulated the sentence wrong, sorry, what I meant is that in general the access to my ISP (ping) is about 1000cps faster with IConnect opposed to STING. With a 56K modem I get 6000cps with IConnect, while connected with STING i'm struggling at around 4800cps.

Accessing the Belgian ftp side with FiFi gives me speeds up to 5000cps, with Aftp running under STING I never managed to get more then 3800cps.

I've been "fiddling" with STING to get it tuned, but the values witch I enter in IConnect don't make sense for STING or vice versa. Whatever I try, STING is always slower and a difference of speed witch approaches the 20% mark, is not acceptable to me.....

>I've it running under N.AES/MiNT, but with this setup you
>can only use Cab, no Fiffi.

Well what can I say, as You know I'm a MagiC adept, works fine for me -)). All the ASH applications work together well and with every new release things get better. If it wasn't for the crippled CAB.OVL I would not use STING at all. I'm sure ASH will correct the situation when a new version of CAB will see the light of day. CAB 2.7 is nearly a year old, a year ago Dan Ackerman and Olivier Booklage efforts weren't much to shout about either.

To put you on Your high horse-): I'm still waiting for a couple of examples why MINT, NAES, LINUX etc are so wooooooonderfullll compared to MagiC. What is it that You can do/run that I can't ? What applications are impossible for MagiC but are easy to do with MINT/NAES ??? pleasepleaseplease let all of us (ignorant MagiC users) know...

Cheers from Belgium

Aha! There's the answer. My long filenames did have spaces. I take it Dan Ackerman's latest OVL solves this. I _think_ I'm currently 2 updates behind. I need to get the latest OVL and Newsie .94 downloaded, but I'm pressed for time at the moment.

I guessed CAB just read the normal file system for filenames. Therefore, it would see the shortened versions of long filenames as you seen on older MS machines. I had no idea that the OVL was taking care of this problem.

I'm a user, not a programmer. <G> But I'm still going to keep the old file naming convention for the reasons stated in a previous post.

I'm afraid I don't understand something quite well. What are nonprop fonts? The Monaco or rufus font are to my best knowledge non proportional bitmap fonts or am I wrong at this point. I'm using Monaco right know but I've used rufus for some time. I never had any probs with that. I do have probs if I use speedoGDOS or true type fonts but that is something MagiC can't handle either, at least that is my opinion after I've installed MagicMac on my brother's G3.

>magazine (Dutch)? Then you know that you are certainly not the only
>soul blowing on the winds of change.

Yep I did and I surely hope I'll work a lot better for me. I've the intention to create a network between my Hades 060 and TT030 as soon as I get my TT030 back. A good friend of mine is busy (are you Jo?) to rebuilt the TT030 into a tower. I also hope that that one-to-two VME port converter works too.
>
>For myself: first MiNt gave me the creeping crawlies.

Installing MiNT is really a piece of cake. Mind you, I'm not talking about installing KGMD or whatever distribution kit, I only talk about the basic MiNT installation as one can use with N.AES or Geneva.

>But after installing N.AES I have calmed down. Bit by bit I took more

I always have appreciated the independance of ST. The reviews are always
honest and accurate which can't be said of the reviews of ST Nieuws.
BTW: What's happening with ACN? It's has been a long time since I received
my last ST Nieuws.

I agree, TOS is simply OUT for me. But ATM I prefer MagiC, since it's
rocksolid HERE (and that's where I work). Mint/NAES crashes on occasions
where MagiC kicks the app out with just an error message.

>I agree, it took me a while to build it up...

Just don't... when it's good enough I'll buy it myself. It may become a
question for me to either switch or upgrade to MagiC 6 (or maybe buy even
both of them...)

Tom, I think the major problem is that it's a differential SCSI drive.
According to the info I have, the pin connections are quite different from
single-end SCSI drives. That would explain a lot.
Can give it a try with DE, but my bet is it's gonna end up with similar
messages... :-(

>
Hi Dennis,

I knew Belgium was divided because of language stuff, but appearently
there's more to it than just that :-)

Actually, my questions are the same, that's why I recently put up
Mint/NAES on my system as well (you probably gathered that I run MagiC as
my prime system for some time). Don't just take it from others, but
experience it yourself. I promised myself to take some time to evaluate it
and that's exactly what I'm gonna do.

But it's funny, you know:

Years ago I started with TOS 1.02. After some time I upgraded to TOS 1.04,
and I recall having asked questions about it.

Later I got TOS 3.06 in a newer machine, again I had to ask some questions.

Then I started with MagiC, and oops, some more questions to ask.

Never got any answer like "well, go back to TOS or "earlier-TOS".

With Mint/NAES it's different, tho': can't really count the occasions I
had reactions like "well, go back to MagiC then". It is a *small* bunch, I
know, but they're sitting on High Horses allright... Sometimes it makes
you feel like a stupid beginner that knows nothing/can't read/is too dumb
to find out himself/etc etc etc.

Sometimes I wonder what this NG really IS for...

Hi Ken,

and it's not just CAB/CAB.OVL having problems with it:
Try loading "long filename.jpg" into Graftool: it won't take it.
Rename to longfilename.jpg or long-filename.jpg or long_filename.jpg and
it will. And Graftool's not the only one...

>MagicMac on my brother's G3.

Hi Martin,

when I talk about a nonprop font, I talk about about bitmapfonts that are non proportional (like the Atari systemfont). Rufus is one. I have some special AES fonts that are. There's also proportional bitmap fonts, like Swiss, Jeneva etc. These won't work right in menu's, so I definitely don't use them.

>And that's exactly the point. For me it looks like Louis is going too
>fast. In his previous mailings he said N.AES this, N.AES that but how on
>earth can one judge about such a complex prog as N.AES only after a few
>hours playing with it?

I believe you (and some others) mistake my "reports" for verdicts. They're NOT, they just state what I'm experiencing. Or interprete them slightly different, then they're questions: "I see a 9x14 nonprop bitmap font in the AES doesn't work OK, is that normal or not?" Can I ask questions in this NG? Or tell others what I'm experiencing?

Again, it's not the decision factor for me on whether or not I'm gonna switch, but I think that when programmers put a feature into a program I should be able to use it and get fair results. I get these from MagiC, I get these from very old GDOS/VDIfont.prg. I don't get fair results from doing it in N.AES... hence the remark. Maybe I'm doing something wrong, but all I get back is "forget NAES, go back to MagiC" or "don't use anything else but 10x16 fonts".

Next I experience my modem won't connect a second time using Mintnet (or Sting). I fiddle around and the solution appears to be killing Connexion after the first run and starting it up again. Leaving it idling doesn't work right. At the same time I decide not to ask around, to avoid answers like "start reading/go back to MagiC/whatever". Weeks later I discover that one/more of the Mint-guru's themselves encounter the same probs.

During the continuing development of MyMail, there was a version with new icons added which made the program crash. People reported it and it was fixed. Not one soul shouted "forget it, go back to Okami!" or similar

stuff. See the difference?

Well, 'nuff said. As far as I'm concerned, let's move on, shall we? :-)

I'm having a hard time believing that MagiC6 handles proportional fonts better than N.AES, simply because the real problem is the applications and *not* the AES! I'm running MagiC6 on my TT, so I know perfectly well how it behaves. The main source for all problems with odd-sized aes-fonts is the simple fact that a large amount of applications (even brand new ones) have poorly written USERDEFs which doesn't check the AES-font but use the VDI-font. In both N.AES and MagiC the AES-font != VDI-font, which breaks many apps. There's nothing the AES can do about this, as it has absolutely no control over USERDEFs.

VDIfont OTOH is more safe in this respect, simply because it replaces the VDI-font. This way the AES and all apps will use the same font by default.

I have been testing the cool-looking proportional font from ATOS 3/98 (IIRC) under both MagiC6 and N.AES, and the result was as expected: Clean apps (like CAB) worked fine under both systems, but not-so-clean apps (e.g. LZH-shell) had problems under both systems. Some dirty apps worked better under one system than the other, but generally I had so many problems with both systems that I went back to the standard 8x16 font.

Non-proportional fonts in odd sizes also causes problems, because while even the AES and normal AES-objects works great (yes, even under N.AES...), USERDEFs which still use the VDI-font for either drawing or sizing themselves breaks everything. The solution is again to either live with it, ditch the problematic apps or ditch the font.

> Next I experience my modem won't connect a second time using Mintnet (or

This is simply caused by killing pppd the wrong way, leaving the serial-port unrestored. This has worked fine previously, and it appears that most people does it, but in later MiNT-kernels pppd must be killed correctly.

Unfortunelately Connexion also kills pppd the wrong way ('kill
-TERM'), but killing Connexion is not the solution ;-) Try killing
chat when the modem hangs during dial-up, and switch it off/on, this
is a workaround that's proven effective on my Falcon.

The correct way to kill pppd is 'kill -HUP' (or 'kill -1'), this way
it restores the serial-port to it's correct state. I'll fix Connexion
accordingly ASAP, but I was kinda hoping to postponing it to v2...

Jo-Even,

I seem to recall having tried proportional bitmaps once in both MagiC and
the combo GDOS/VDIfont.prg, and like I said: your menu's go crazy with
these. So these are out of the question to use.
In fact, N.AES itself works correct with different types, indeed it's some
apps that won't: Newswatch/Popwatch losing characters, Mintsetter ditto.
Some apps display 100%. But, doing it from MagiC they have NO problems :-)

I've read about it in the Mintlist. What I meant by "killing Connexion" is
hit the "closer". I can leave it idling (somewhere on my screen, after
"disconnecting"), on the next click on "connect" my modem won't connect.
If I "close" Connexion, then start it again it usually works OK. Same
stuff btw for Sting: I have to shut down the dialer first, and call it up
again to get the modem working again. Not a big hassle really, once you
know how to handle it. But a future fix might be handy :-)

>- can differential SCSI devices be used on the TT's SCSI bus (it appears
> there are converters for diff. SCSI)
>- can differential SCSI devices be used combined with single-end SCSI
> devices on the bus?

If you have the right cable adaptors and the right termination..
But i can't say if it works. No chance to test it.
(Remember, differential SCSI use any Singal twice)
(Two tracks, one for -, other for + signal)

Different SCSI types can be combined, but same as upper, you can use
all the devices on one bus. (Says the SCSI-Standard)

You must have the right (host!!) controller for differential SCSI, after the
differential device you must terminate the differential bus! and after the
latest SCSI device you have to terminate the normal SCSI bus.

Not easy to handle, some people say that works.
Need's a lot of cable adaptors, special terminators..

I'm sure nobody tested that with an atari!

If you like to test it:

Atari normal SCSI -> SCSI/Diff. Adaptor -> Diff. Device-> Diff.Terminator. (or, next line)

->Diff.Device-> Adaptor to normal SCSI-> SCSI Device-> SCSI Terminator.

That's the way if it can work, but that's not must!!
(Nobody tested this)

The answer of your next question:
I doasn't know how you can take the right cable adaptors and terminators.

Have a look to DOITDRIVE..

Regards, Robert

>answer this today or this weekend Maurice.

In 95% of all hard drive replacements the hard drive doasn't need to format.
Connect it, create your partitions, that's all. (If the drive is new)

The way to replace the internal falcon IDE you found as complete description
in DOITF030. The free Hardware Manual for the FalconF030.

Best Software to format & part., is HDDriver 7.6
(With support)

I'm sure you can't found any comparement as download on the web.
Try the demo release of HDDriver.

Also you can use latest release oa AHDI for that..
Old, slow and no support.

You doasn't need to format the drive only that the machine "see" the device.
It's enough if the machine found a drive on this drive.

Sure, while installing the driver, media must have atari compatible format.

Hope that helps.

as
> ZIP, LZH, ARC, etc... for my archiver program).

I use MagiC5 but I imagine it won't be radically different in 6.

To install an app, select the program's icon in a desktop window, then go
to "install application".

You then get the box asking you if it needs single tasking, memory
limitation etc etc. Alter as necessary, then click the "install" button.

You then get a dialog box with two columns, a list of apps on the left and
associated files on the right.

Double-click the app's icon in the list to open the icon picker window. To
assign an icon, just drag it onto the icon in the list.

To associate file types, first make sure you have still got your new app
selected in the left hand column, then click the "new" button under the
right hand (associated files) column: you'll get a box in which you can
enter the file extensions. Once you've OK'd the box, the file types will be
listed in the right hand column and you can drag icons to the list icons in
the same way as for apps.

Just a hunch, but did you have any spaces in the folder or file names? In
which case you may have problems with many browsers as spaces are illegal
in URLs IIRC (as are some other punctuation marks).

Long names per se are no problem, as the WWW originates from the Unix
universe: I'd be very surprised if you found a browser that couldn't deal
with them.

I have a 4-meg Atari ST, both monitors, monitor switcher, laser printer, hand scanner, frame grabber, 20 meg drive. All work, EXCEPT I can't get the hard drive working right now. It's been so long since I used it, it might be me.

I've got loads of software, like games, almost all the stuff from START magazine, including floppies and bound books of the magazines, also Compute's ST mags and disks, Pagestream (still the best program I ever used), Chronos 3D renedering and animation, etc. I have that cool desktop program that let you put program icons right on the desktop years ago (I remember new PC/Windows users not knowing how to use a mouse just a few years back...pretty funny to someone who had about 3/4 of a Mac for about 1/4 the price).

I can make up a list and post to your mail or maybe a web page if needed.

I would like to sell all...well, I will sell all. What is it worth? What am I bid?

I am in the Dallas area. It would be better to sell around here, to avoid shipping...there's a lot of stuff, all original software boxes, etc. I used to be in AUNT...anyone still out there?

Please reply to

scarroll@iglobal.net

if interested. I will supply more info as/if needed. If anybody from the area wants to come buy with a handful of cash, write!

Thanks!
Steve Carroll

I would guess that your Falcon doesn't have an internal IDE drive and the delay is due to the driver looking for this first of all. There is a way to bypass this with some hard disk drivers, but I am afraid I don't know the details. Try holding down Shift or Alt during booting.

t> I have troubles with my beloved Atari 1040 ST. It doesn't see my
t> floppies anymore :O(I mean inserted. What could be possible the
t> problem with it?

Hi Tsar!

Are these floppies that it read before or new ones? If it used to read them, then it may be you have dirt on the head, or a connection has come loose - or the drive or its controller has just failed. Try cleaning the head with a cleaning disk first, then open up the case and make sure the connector is on tight. If this doesn't help, see if you can borrow a PC drive and see if it works - you will have to reset a jumper and also turn the connector upside down compared to the PC.

Just one thought - if your machine is old it may have a single-sided drive which won't read double-side formatted disks. Try formatting a DD disk from the desktop and see if it can be read.

/Peter/

Hello. I read through the Quick-FAQ, but I still have a bunch of questions. I'll explain my situation, then go from there. I have 8 Atari 1040ST computers and 4 Atari SC1224 monitors. I was trying to check them out last night, but I do not know what to do. I do not have any software at all for them. When they came on, all I could get them to do was beep when I pressed a keyboard key. There was a mouse cursor on the screen, but I don't have any ST mice.
If anyone knows of any web sites or can just offer any advice, I would really appreciate it. I have had 3 of the computers for over a year, but never could find a monitor for cheap until yesterday morning, so I have never used an ST until now.

Thank you,
Jason Whorton

And how much did you have under TOS 1.04, as a comparison ? I'm quite certain that on a stock 1040 you can't have 1024K free. TOS always takes up some RAM.

At bought some equivalent screws at my local DIY shop. Just bring one of them with you to make sure. Oh, and the one for the front-middle hole is shorter than the others. I learned this by screwing a hole through the top panel of my old STF...

> some RAM.
>

You are absolutely right.

Its some 6 or 7 years ago I did the upgrade and my 1040 dates 1987.
I think it was the first series of 1040STFM with a early version of
Tos in roms. I remember clearly "TOS 1.0" and "GEM 0.19".
But more vividly I remember that the ram used by TOS was somewhat
below 48000 bytes. Now at these edges we can better talk in exact number
of bytes.
So that leaves 1.048.576 minus .... = slightly more than 1.000.000 :-)
I also can remember that I found that funny at the time, there you have a
1 Mb machine that gives truly a million bytes to you! ;-)

So talking in K's even by experts can become confusing.
And I also should not have put that K behind the 200 and instead say 200.000 .
sorry for that.

Another interesting point is the following: but I dont know if it's true,

I had strongly the impression that 2.06 was a direct derivative from 3.0x
It came afterwards and it started right at .06.
I think that the much larger screen save areas for coping with the TT medium
video were just kept in this derivative. Is it possible that this is once
silently corrected without changing the verson number, hence this discussion.

Greetings.
Henk.

IDE Drives as standard assume they are the only thing on the interface. Hit
your manufacturers websites for information on how to set the jumpers on
them so that one is the master and one is the slave drive.....

Source record: 85224

This may be of interest to some of you.

I was for some reason looking around in comp.os.linux.m68k newsgroup.
There I found that the linux m68K group is franticly working on a FPU
emulator.
A emulator for linux can be beneficial for TOS's as well.
Because this should be completely OS independent.
They're only instructions, are they, them line_f 's. :-)

The program thats puts a line_f emulater in an Atari already exists.

They actually invite people to join in.

Try Linux/m68k Frequently Asked Questions: Common problems
paragraph 8.18.

Greetings

Henk Robbers.

APEX media is an animation and graphics program (as you may have gathered
from the manual). I've owned it for a number of years now and have yet to
see another program of the type to better APEX.

Which disk do you have? The 1st disk has the program files on and the 2nd
has examples on it, although there may also be some APEX system files on
the 2nd disk too. Hopefully you have the 1st disk which means you have
program. If APEX.PRG is on the 1st disk just copy that and anything else
on it to a directory on your hard disk. Run APEX.PRG and prepare to be
gobsmacked! :)

Let me know how you get on...

best regards,

Chris Wilkinson,

Digital Alpha maybe (that will sit on your desk!), but a Cray? You must have 400V 3 phase power and a warehouse for a computer room! :)

My choice is 520 or 1040STe. You can use 1 meg SIMMS to upgrade to 4 megs RAM, plus DMA stereo sound, BliTTer chip etc...make this a cut above an STfm machine...

>them so that one is the master and one is the slave drive.....

With a simple IDE replacment in your falcon you have nothing to do
with jumpers or something..
If you replace the internal IDE it is automatically a master, with or
without any jumper. If you add a second IDE, you have set the jumper
from the first drive to "master", on the second drive to "slave"

2.5" IDE devices only have these two jumpers!
Master nearly the connector, slave far from the connector.

Hi Brian,

Be very careful when trying to install Apex if the disk has never
been infact registered. The way to tell is, powerdown your Falcon,
insert the disk, and fire up the bird again. If it is an original disk
that has not yet been registered, it will boot the machine for you and
take you to a registeration menu. Make sure you have the serial number
wrote down, IE, do not take the disk out of the drive to check. You
only get one chance at doing this, else you have to ship the damn
thing back to the UK to be fixed. Once the process is done, you can
copy the files to your hard disk. There are two disk, but you need to
know what version you have to know which files off the second disk you
need (if indeed you do have the first disk).

Mike

>
Hi Martin,

well, I've said it before and will say it once more: I'm not evaluating to put a verdict on any of the two. In time I've heard people talk about Mint and N.AES that made me curious. So I'm gonna try it myself. The fact that MagiC on my set is rocksolid has nothing to do with it. Of course I'm comparing, at the same time I know that setting it up 100% will take time. The things I'm encountering meanwhile will be reported, not to put anything into discredit, but simply to state what I'm experiencing. In the end it could be a small glitch, or simply a wrong setting. One can find out by telling others.

It wasn't in this NG, but years ago I have been wrestling with MagiC too, telling others what I experienced with it. It simply ended up in finetuning, which in turn resulted into one rocksolid OS. And yes, some apps won't run from it... Mostly very old ones or "schweineprogramme" (which in fact won't run from Mint either).

As for now, I'll continue digging/wrestling/reporting :-)

Meanwhile, your suggestions/solutions, as well as those from others, will be appreciated as before.

Exactly.
There are two more things:
1. It is in not allowed to have any other name
than localhost, loghost etc linked to 127.0.0.1
2. nfsd is very rigid about permissions: /etc/exports needs to be owned
by root (group wheel) and is expected to have permissions 600.

Boy am I glad you are still doing this. I finally printed out that list.
I come and go from this newsgroup (computing actually) in spurts and after
numerous hd crashes from fooling around with stuff and not keeping up regular
backups, it was my pleasure to find myself without a recent set of ftp sites.
Anyways, I waited with patience hoping you were still doing the monthly update
and I am very greatful, once again.

I have decided to reengage my addiction after a six month hiatus, which is far
less time to be away from computing than the last 7 years I took off.

Thanks Hallvard, for keeping me informed.

The on screen error message says "Floppy disk defect or Check your connecting cables". Something like that I have a German ATARI 1040 ST fm version.

I didn't use this machine too long. I happened to have two of them. I always used my first 520+ machine without bigger problems for many years and then I found somebody who was interested in purchasing it. So I sold it and was happy to use my 1040. The first thing I noticed was that floppy drive was much louder then my external drive with 520+. Anyway we've been playing a month o two but one day using PC-Ditto I loaded MS-DOS 6.22 and my computer crashed it was late so I just switched it off. Next day my son reported anxiously that ATARI is suddenly saying to all of our disks that they are all defect. I remember also throwing the computer carefully on the couch for cleaning on my desk. Horror story from Moscow +:O)

Now I get my desk top ok but when I'm clicking on Floppy the drive makes noise like searching for tracks you described and after a while reports that whether disk or connection were wrong.

Got my copy of ST on Friday morning, as always a good read - yes I read
some Dutch! I liked the little piece with the English to Dutch translation
of some special words!

>BTW: What's happening with ACN? It's has been a long time since I received
>my last ST Nieuws.

Yes, I only thought today it was some time since I received a copy. Issue
100 was the last one I received - is that the latest?

Kind regards

I have an Atari Portfolio I am considering selling. I have the boxes, manuals, cables, card drive (w/card for pc) tutorial and driver disk for your computer. I am not desperate to sell it so I will consider "SERIOUS" offers only. This machine could be put on a shelf in any store and sold as new. It looks that good. Please include shipping in your offer.

Hi Louis! Yep, some people don't understand-you're right there...I'm going
by 3 very different sources:

1) TOS - No spaces, of course..
2) Amiga - where it says in most places that you can use filenames with
spaces, but *don't*...
3) Unix - the Unix books I've read also say, don't use spaces...

Well, thats 3 different ones, all respectable, and thats good enough
for me... ;-))))

>faulty cart with any important data
> i have had one 135 go faulty and it was exchanged without question
>by the dealer i bought it from,by the way syquest are no longer in business but
>cartridges will
>be available for a good while yet
>

Yes SyQuest got took over! typical I buy something and I can't find the
cartridges.

Why is this, I bought a good Citroen, a few years ago, knowing I had a
very good dealer in my town. The day after I bought the car, they
buggered off.

Could someone point the way to where these are still sold, and if
possible where I can get PD optical disks.

I'm in 2 minds at present, whether to keep my SyQuest drive or get an
external SCSI case for my PD drive. I think this would be determined on
the media availability and cost.

If anyone can enlighten me, I'd be most grateful. I would like to get
the many thousand floppies I have, put on media that takes less spaced
up.

I did that. ;-)

2 week ago I send them a email in which I complained about
the fact that although there colofon stated that you get 12 issues per year
for your money, I had only got 3 1/2. I also presented them with a litle
scheme telling them which months were absent.

Now this colofon statement has gone as well.

"Due to complaints about our service we decided not to
deliver service anymore".

That upgrade will solve your problem.
NVDI 5 uses services that are new in MAGIC 6.
If you dont want to wait for the upgrade, put WDIALOG.PRG, which is
part of the NVDI delivery, in your autofolder.

Greetings.
Henk.

Have you tried looking at the task list (Alt-Control-Esc) before
shutting down? This will tell you the state of all loaded programs, and
allow you to change the current one, close down programs etcetera.

I use FASTBOOT on my C-Lab Falcon (no IDE). Running Fastboot bypasses
the memory test and search for IDE. It lets C drive (on my Seagate)
boot in much shorter time! I'll try to E-mail you the program.
Run it once and I believe it writes something to Drive A (floppy)
letting C drive know what to do from then on.

All depends on what you want from a screen saver. If you want a pretty screensaver that does lots of cool things while you're not there, then this means taking up CPU time, and unless you are running under preemptive multitasking then this will mess up whatever the computer was doing before kicking in.

If you just want screen saver to black out the display, and even speed up the CPU while doing so, you should try TurboSaver. It must be on most FTP sites.

This could be true. When running under TosBox on a PC, TOS 2.06 is capable of displaying higher resolutions than it was originally made for. TOS 2.06 had some other hidden features, like IDE support or fast ram support, when no ST ever was factory-equipped with an IDE drive or over 4Mb.

I somehow beleive that the RAM it is taking up has to do with the new desktop. IT could be reserved RAM for user defined icons or for the newdesk.inf file.

>I have no idea how old these cartridges are:-).
>
Brian,

I almost forgot about this one :-) Actually, I only run an old 44-meg type here, and it sits in my tower, together with some more SCSI devices. Tower has power on 24 hrs/day, usually I take the cartridges out or leave them in but push the button so the drive stops spinning (read: the loud whining stops). Taking out a cartridge: only after the drive has stopped. I once had a friend, operating several of these drives for DTP. I recall I was with him one day, he was finishing a piece, put it on the Syquest, and after he saved he clicked the button and a split-second later operated the lever and took out the cartridge. At the very same moment he realized what he'd done, said "S-H-I-T-!", started it up again and the drive was wrecked. Or better say: the contents were... Won't tell you what he yelled afterwards... :-)
This today still is being replayed continuously in my mind, so I do care about it.
So to answer your questions:
1. Yes, sometimes I do, sometimes I don't
2. Not even that always
3. My cartridge only spins up after a full insertion plus operating the lever. I never start up with a cartridge in, lever into place. Or, saying it different: I only start up the drive when the cartridge is fully in, I don't think you can start it without a cartridge.

I recall Dennis Bishop informing us some time ago about a Syquest, spitting heads around...

HTH,

Hi Gregg,

Dr. T, is no longer in business, but did you know that you can get the profiles for free from the MOTU website? (Mark Of The Unicorn) They took over X-or and the program is now called "Unisyn" - only available for PCs and Macs. However, the PC (or Windows) profiles will work on the Atari. I tried it, and it worked(!), so there are profiles for just about everything available to download:

http://www.motu.com/english/software/unisyn/unisyn.html

Regarding profiles you get from MOTU web page - they will have file extensions of .UH1 and .UP1. Change .UH1 to .HLP, and change .UP1 to XOR, and put them both in the working directory along with the .PRG files. I've tried putting them elsewhere to help tidy things up, but the program doesn't seem to like that. There is a .TXT file about the set-up program that explains a lot.

I hope that helps,

Clayton Murray

Thanks for that bit of insight. I am never current on whats happening anymore.
I guess I better buy some cartridges. As for the on, I was using HD driver to
mark the sectors and it was taking forever and there were just to many for
my comfort. Even still Hd driver wouldn't format it so I figured it was pretty
bad. I hope the mechanism is ok and not wrecking the disks?

Finally, your message was helpful although hard to read in my newsreader.
Manywords were past the screen and I can only read them when I reply in my
editor and scroll the page.

Is this a problem with my software or yours? I thought posts were to be 80
columns?

>know what version you have to know which files off the second disk you
>need (if indeed you do have the first disk).

I have the first disk called INSTALL DISK. It does not appear to autoboot
from the falcon. The readme on the disk simply states to place the
APEX program in a folder called APEX. Then copy the SYSTEM folder into the
APEX folder.

Yes, I have read the install manual, and I was afraid to test the autoboot
for fear of it starting registration and asking for the second disk:-).
Thanks for the don't remove the disk before registering tip. I do this often
after the fact when I have placed the disk in the machine.

I would have to say that this has been installed before and registered
to the previous owner. Indeed I do have a bunch of viewers on the harddisk
that are TTP and are Black Scorpion products.

So Clearly I think I am ok and merely need to find the second disk.

Yup, I just powered down the Falcon and it doesn't autoboot on my second
attempt. I guess the registration data embeds into the program.

I personally like seeing my own name on the software. Unfortuneately with
a second hand machine its not my name that I am seeing on many programs:-(.

There were alot of programs such as Magic and NVDI that I got that he purchased
and never took the time to install. These now bear my NAME:-).

> This was my little sarcasm, because Nicolas Bales offered Falcon or Milan
>when question was 'which Atari ST is best'.

Must have forgot to offer the atariSTHADES:-).

Really the best Atari ST is MINE.
1985 520ST has served me well for 14years. There is very little I can't do.
I am on the internet with it, multitask with it, Run old TOS 1.0 programs with
it, Run games, Laser Printer, Publishing etc. Its only hardware mod is an
extra 2meg of ram I put in, in 1987 when I got my Printer.

With PhotoChrome and Speed of Light I can see pictures as good as anyone,
(ok pretty darn good none the less) being slightly inferior to my STe.

Some STes you must be carefull before buying. A number of them were imported
into Canada from Mexico and they had ST DMA chips which don't allow use of
the Harddrive without corruption. (IE MINE) which is why it is not the best
for me.

Well thats my humble opinion from my humble ST.

>.

Ah well, here is my response in the other group...

Nope - we are still alive and kicking. :)

If you are looking for www.cyberstrider.ORG, the server is moving this weekend. The leased line was shut down and a new one is now up and running. The servers are in the process of being brought back to life and should be up and running by Monday.

Due to the new leased line, a whole host of routing needs to be set up etc etc etc.

if you are looking at www.cyberstrider.NET - that is still there, but the links from there lead to the .org site for the moment.

Apols for the inconvenience, but I was expecting the older leased line to still be operating for another week.

Regards
Danny

B > What is exactly the deal with extendos, spin, metados and all
B > that ?

Well, I'm no expert. But I bought a CD Rom drive from a friend, a 2X Toshiba SCSI that had been removed from an Infernal Boring Machine. I hooked it up to my TT, and bought Extendos as a software driver. Extendos is commercial, available in North America (and maybe elsewhere), and was written and is well-supported by Roger Burrows, Anodyne Software, Canada. It now comes with an install program for guys like me, and it works.

Lots of neat things on CD Rom, including encyclopedias, pix, clipart, and fonts.

I know nothing about spin and/or metados.

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. E-Mail me or call me at
440-286-2567 evenings EST. I am also open to trade offers.
E-mail me your list.

HARDWARE

Falcon Speed by Sack Electronic
Intel 286-16mhz IBM processor board for the Atari Falcon computer
Run DOS and Windows 3.1 programs on your Falcon
Norton SI Factor of 12
Sound Support
Up to 8 Meg of IBM RAM
VGA and SVGA video modes 640x480, 800x600, and 1024x768 under Windows 3.1
Switch back and forth between TOS and DOS modes $100.00

Syquest 5 1/4" 44 meg removeable cartridges. Will be HDX formated and
verified good. each $15.00

Atari SC1224 Color Monitor. Unit is in perfect working order.
Comes with power cable. $50.00

Atari SM124 Mono Monitor. Unit is in perfect working order.
Comes with power cable. $40.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $45.00

Supra 2400 baud external modem. No power supply. $3.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 as a stand alone fax machine.
Comes with special fax modem, diskettes, and manual. $35.00

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

Conquest of Camelot by Sierra. Complete with box, docs, and disks $9.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $10.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $15.00

MISC SOFTWARE

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $5.00

BOOKS $5.00 each unless noted

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples. $5.00
Thunder! The Writers Assistant manual. $1.00

Atari Computing Magazines $6.00 each with cover disk

Issues # 4 5 6 7 8

MAGAZINES

I have a large selection of mostly 80's and early 90's Video Game and
Computer Magazines, Books, and Newsletters for various systems.
Please E-mail me for a current listing.

This has definitely nothing to do with DOS/TOS issues. It's a low level
hardware problem you have. Either the drive is broken or not properly
terminated or the cables are bad.

You can't write to SCSI maintenance tracks.

Sounds as if the sector cache (see "General" options) is too large.

>terminated or the cables are bad.
>
Hi Uwe,

as you've probably read by now your assumption "bad cable" isn't too far off, it appears to be a differential SCSI type. That would mean all connections are different.
Meanwhile I had a conversation with a firm over here specializing in SCSI stuff, they told me you can damage the hardware by hooking a diff SCSI device into a single-end bus, there are adapters available at a cost of approx. USD 500,- so I'm gonna try to replace this drive once more for a "normal" one...

Bottom line note: DON'T BUY IBM 0664 drives, they're differential SCSI and cannot be used in a regular SCSI-chain!!!

Hi!

In article <36b30d30128bc571@lvdi.net>,
outrider@lvdi.net (Terry May) writes:
> I don't know. Olivier Booklage's CAB.OVL solves it. At least for
> CAB. You still can't do background downloads with spaces in the path
> or filename, though.

Well, note that using unquoted spaces in filenames inside HTML-anchors isn't correct. According to the relevant protocols (see RFC 1738 for details, especially the part on "Unsafe characters"), URIs and URLs (like filenames) have to be free of "unsafe" characters like " ", "<", ">", and some others.

That is, these characters have to be encoded, by using a percent sign and the two-digit hex-value of the character in question, e.g. "%20" for a space. Thus, linking to a file "this is a test.html" in an HTML document should look like this:

<A HREF="this%20is%20a%20test.html">Testlink</A>

There are browsers (e.g. Internet Explorer on Windows, but not Communicator on UNIX) which tolerate using unsafe characters and automatically encode them when following the link (look at the resulting URL in the browser's window afterwards, it will have the spaces encoded as described above). But if you want to ensure to be compatible with all browsers (and, even more important, follow the relevant standards), encode your spaces.

Note that a good browser also works correctly when testing such links locally, so that the above example link will cause the browser to access the correct local file. I haven't checked this with CAB, but I assume it will work. It does with Communicator and lynx on UNIX.

Ciao

Thomas

2054. FREE Atari Catalogs by E-Mail, FTP & the Web! Free Atari stuff!

Newsgroup: comp.sys.atari.st
Date: 1999-02-01 00:00:00 UTC
From: bensmith@user2.teleport.com
Message-ID: <7945ei$88r$1@user2.teleport.com>
Source record: 85150
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,or.forsale,pdx.forsale,pnw.forsale,rec.games.video.atari,

Please direct all replies through E-Mail to bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I do not regularly read NewsGroups.

I have some stuff to unload. I have a lot of Atari Magazines. For the person who takes the whole lot. Some including disks. I don't want to have to go through them or sort them out. I just want someone to take them off my hands for the cost of Shipping. Classic Atari 8 Bit & Atari ST. I also have some Atari Hardware that doesn't work that someone can have for spare parts or tinker with to try to repair.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my Desk-Top Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can load them into your text editor or Word Processor and view them, edit them or print them out! It would make things easier if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend. Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Are you a member of the former Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990?

Then you should not wait a second longer and surf over to http://www.fortysecond.net/stniccc2000 to discover that, in fact, a reunion of that very historical event is being organised for December 2000, a 10th anniversary reunion as it were! It is going to be the coolest event of the millenium, I can assure you!

Please note that the URL has changed, so if you have any bookmarks set up, please correct them.

Try running WDialog.prg either from the Auto folder or from the desktop.

M6 has WDialog functions built in so you'll be able to ditch it once you
upgrade.

Sat 30 Jan 99 Nicholas asked;

>The problem is I have no experience in this. What is exactly
>the deal with extendos, spin, metados and all that ?

Hi Nicholas, I'm writing this with ASH EMailer so I'll keep an eye on the linelength -))

METADOS was made by Atari, over the years many people have upgraded it and now it is the standard and supported by ALL OS. METADOS comes with two drivers; *.DOS and *.BOS, a small config file tells METADOS where the drivers can be found, on what port the CDROM is connected and what drive letter should be assigned to it. It sounds more complicated then it is, just a little bit logical thinking.... MetaDOS is freeware

EXTENDOS is a commercial CDROM driver, installation is very simple and it supports nearly all drives. There is a program incuded with wich one can play Music CD's. EXTENDOS GOLD is a commercial CD ROM and Writer Driver, installation is also easy. Both these programs are well suited for people who can't be bothered/know nothing about config.files etc... I'm not sure if it runs/supports all OS.

EGON CD Utilities is also a commercial program, it's based on METADOS and comes with its own *.DOS and *.BOS drivers. It runs under all OS and is compatible with all major applications. Installing it is very simple

CD Tools is a commercial program with the same features of EGON. I think it is no longer supported ... ??

SPIN is a shareware program written by Julian Reschke, when run from MINT or MAGIC you can read MAC HFS CD's and see/copy files with long file names. SPIN is the ONLY CD driver wich allows this. Under plain TOS this packet works equally well. But You lose the benifits of the long file names and being able to read HFS Files.
SPIN is also ideal to grab music tracks from Music CD's. It saves them as *.WAV files. When run from MAGIC, NAES/MINT it uses a XFS driver instead of METADOS.

BETADOS is compatible with METADOS and ads some goodies like clusters and compatibility with MAGIC 6.x shared library's. It runs on all OS.

CD RECORDER PRO is a program for CD Writers, it supports all the major standards, but not CD rerecordable yet. The program uses METADOS and its own *.BOS driver. There's no installation program supplied, so you have to do that yourself. Before bying a CD Writer check the compatibility list, not all CD Writers are supported.

CD SOLUTIONS is the same thing as the one above, but for the MILAN clone.
This one can use CD Writers with IDE interface, note that for some bizarre
reason CD RECORDER PRO doesn't work with the SCSI card from the MILAN.

Well this sums it up, I think. So what do you need to connect a CD ROM to
your Atari ?

-SCSI CD ROM
-SCSI to DMA convertor (LINK, ICD etc..)
-One of the programs mentioned above
and that's all there is to it, it's just as easy as connecting a harddisk.
BTW: You don't need a harddisk to have a CD ROM connected. The drivers are
so small you can easily boot from disk.

When buying a CD ROM don't be blinded by speed, the AHDI/SCSI interface on
all standard Atari's can't sustain more then 1800Kb/sec. So buying a 32x or
36x speed CD ROM is just waisting money. A 12x speed is perfect and can be
obtained cheaply from PC-Nerds who always NEED faster drives to run Micro$hit
applications -))))

A good program to play Music CD's is CD Player from Alexander Claus, it runs
on all OS, has a built in database that keeps track of your CD's and is it
also possible to extract music tracks with it. CD Player is freeware.

On Atari's and clones with a IDE interface You can also connect a IDE CD ROM,
METADOS can handle these with no problems. The advantage is speed => 36x at
full speed. The disadvantage is that you lose one of your two possible IDE
connections...

There's probably a lot I forgot here, but to start with this should keep you
busy -))) and with no doubt there will be a lot more postings with tips and
comments coming in...

Source record: 85165

Martin commented on Sat 30 Jan 99;

>>What applications are impossible for MagiC but are easy to do
>>with MINT/NAES ??? <<

>To name a few micq and java. Java ofcourse only on quick machines. There
>are sure other prog's.

I think You mean JavaScript, this has nothing to do with MINT but with the
browser understanding it. AFAIK CAB, Wensuite and Draconis don't support
JavaScript for the moment. Java is a programming language wich is not
available (yet ??) for the Atariplatform.
I don't really know what micq is (I'm not a MINT adept) but I gues it's some
kind of IRC client, if this is so. Well no problem here either, this is a
job for STING and it runs just as well under MagiC.
BTW: when I asked for applications I ment real life applications, like DTP,
Database and Spreadsheet applications, Graphics processing etc...
Don't tell me that You and all the other "misleaded" went through all that
trouble just to run a couple of PD/shareware utilities ????

>I'm not a Linux adept but isn't it possible to use Netscape with Linux.
>Try this with Magic:-))

I'm not a Linux adept either, I'm a TOS/MagiC adept, I know Netscape runs
under Linux now.
But I would like to see it run on a Atari/clone. I really would like to know
what guru is going to transport and amend the code wich is immens to the
Atari platform?

While on the subject I haven't seen any of the other "STARS" ported over
either: GLIMP, IMAGE MAGICK, STAR OFFICE, APPLIXWARE, LyX, NoSQL, CD GEAR,
WORD PERFECT 8.0, LaTEX Frontend.... etc just to name a few.
Well Martin, I hereby swear that when one of these applications become
available for the MINT/NAES platform I will THROW MagiC out and become a
"believer" also.

Open Your eyes and welcome in the real world

Looking forward to yours an other MINT lovers replies.....

Cheers from Belgium,

Den Dennis

Sunday, 31 Jan 99 Keiyh asked;

>Anyone know whether NVDI has a driver for an Okidata 4w or 6e? Do I need
>to build one?

Use the HP LaserJet driver for the OKI 6e. No problems....
I'm not 100% sure but I thought that the OKI 4W is a Windows GDI only
printer. If so, well, get rid of it..... sell it to a PC-Nerd.

Cheers from Belgium

No, he means Java, which currently needs MiNT (or Linux, but then it's
not an Atari anymore...) to work. There is no implementation of
Javascript for TOS or compatibles.

> I don't really know what micq is (I'm not a MINT adept) but I gues it's some
> kind of IRC client, if this is so. Well no problem here either, this is a
> job for STING and it runs just as well under MagiC.

micq is a ICQ-clone which works under MiNTnet. There *is* other
options than STiNG to get on-line ;-)

> BTW: when I asked for applications I ment real life applications, like DTP,
> Database and Spreadsheet applications, Graphics processing etc...

There's basically nothing of this sort that needs MagiC or MiNT
specifically, although newer ASH-software usually works smoother under
MagiC. However, those apps really shine in a decent environment, which
is why MiNT-addicts run MiNT and not "the other OS". The more complex
environment is harder to understand, but once you do you have the most
powerful TOS-compatible OS at your fingertips. Ask Linux-users why
they don't run MacOS instead, when it's so much easier to get started
with.

> But I would like to see it run on a Atari/clone. I really would like to know
> what guru is going to transport and amend the code wich is immens to the
> Atari platform?

Netscape for GEM? Forget it! One thing is the *huge* efforts needed to
port it, another thing is that it will be so big and slow that you'll
need atleast a 060 to get it half as fast as CAB on a Falcon...

> While on the subject I haven't seen any of the other "STARS" ported over
> either: GLIMP, IMAGE MAGICK, STAR OFFICE, APPLIXWARE, LyX, NoSQL, CD GEAR,

Do you want to use X? Then these apps can most certainly be ported to
MiNT. Do you want to use GEM/AES? Then it's not a port at all, but
nearly a total rewrite. Check out the Windows-version of GIMP...
No sane person would spend that much time on porting these apps when
equally good software can be written from scratch in less time.

The on screen error message says "Floppy disk defect or Check your connecting cables". Something like that I have a German ATARI 1040 ST fm version.

I didn't use this machine too long. I happened to have two of them. I always used my first 520+ machine without bigger problems for many years and then I found somebody who was interested in purchasing it. So I sold it and was happy to use my 1040. The first thing I noticed was that floppy drive was much louder then my external drive with 520+. Anyway we've been playing a month o two but one day using PC-Ditto I loaded MS-DOS 6.22 and my computer crashed it was late so I just switched it off. Next day my son reported anxiously that ATARI is suddenly saying to all of our disks that they are all defect. I remember also throwing the computer carefully on the couch for cleaning on my desk. Horror story from Moscow +:O)

Now I get my desk top ok but when I'm clicking on Floppy the drive makes noise like searching for tracks you described and after a while reports that whether disk or connection were wrong.

Tsar-daddy

P.S. Heads clean, cables firm. Heads go to the outside track and search there for data I assume while slightly moving 1 mm for and back but nothing happens ;O(

BVT> After shutting down the computer and then rerunning MAGIC my invisible enemy
BVT> had dissapeared.

If I recall correctly, you can program the SHUTDOWN program to ignore
certain programs that are running and proceed with the shutdown
sequence. Find your SHUTDOWN.INF file and include a line that says,

"ignore NAMEOFYOUROFFENDINGPROGRAMWITHOUTTHEEXTENSION".

I used to have a problem with Newsie locking up my computer, so I
included the line, "ignore NEWSIE", and it would shut down even though
Newsie was still running. Leave out the quotation marks.

Just a few comments from someone who uses neither Mint nor Magic...

>>>What applications are impossible for MagiC but are easy to do
>>>with MINT/NAES ??? <<

A ton of Unix software has been ported to work under Mint, making it
much more flexible for running Internet applications, with many more
Internet Apps than any other Atari-compatible OS.

>>To name a few micq and java. Java ofcourse only on quick machines. There
>>are sure other prog's.
>
>I think You mean JavaScript, this has nothing to do with MINT but with the
>browser understanding it. AFAIK CAB, Wensuite and Draconis don't support
>JavaScript for the moment. Java is a programming language wich is not
>available (yet ??) for the Atariplatform.

No, actually, I've seen the Java software while browsing through what
was available for Mint. It only runs on Mint and doesn't seem to have
much to do with any browser (or at least none in particular). It
wasn't Javascript - I know what that is. This was different.

>I don't really know what micq is (I'm not a MINT adept) but I gues
it's some
>kind of IRC client, if this is so. Well no problem here either, this is a
> job for STING and it runs just as well under MagiC.

Actually ICQ isn't IRC. It's somewhat similar in that you can chat,
except that you have a list of people whom you normally like chatting
with, and when they are available (online) their name comes up on
your ICQ window. You can then send them a chat message letting them
know you want to talk. You can then make a private connection
between the two systems and chat without any need for an IRC
server. It's very popular in the PC/Mac arena. Most of my family are
on ICQ, and always chat with each other this way, but not having
Mint, it is impossible to use ICQ on my Atari, so I'm very
discouraged by the fact that no one has done an ICQ program for
STing. This is probably the most compelling reason for me personally
to want to choose Mint over Magic.

>BTW: when I asked for applications I ment real life applications,
like DTP,
>Database and Spreadsheet applications, Graphics processing etc...
>Don't tell me that You and all the other "misleaded" went through all that
>trouble just to run a couple of PD/shareware utilities ????

In this case, you're right. EVERY Atari OS can do these things, so in
that way Mint isn't better than Magic. But also vice versa. Also,
aren't Internet Apps "real life applications" also?

>>I'm not a Linux adept but isn't it possible to use Netscape with Linux.
>>Try this with Magic:-))
>
>I'm not a Linux adept either, I'm a TOS/MagiC adept, I know Netscape runs
>under Linux now.
>But I would like to see it run on a Atari/clone. I really would like to know
>what guru is going to transport and amend the code wich is immens to the
>Atari platform?

Most likely, if it were to be ported to Atari, it would show up on
Mint before it would on anything else, being that Mint is a Unix
clone like Linux is.

>While on the subject I haven't seen any of the other "STARS" ported over
>either: GLIMP, IMAGE MAGICK, STAR OFFICE, APPLIXWARE, LyX, NoSQL, CD GEAR,
> WORD PERFECT 8.0, LaTEX Frontend.... etc just to name a few.
>Well Martin, I hereby swear that when one of these applications become
>available for the MINT/NAES platform I will THROW MagiC out and become a
>"believer" also.

One thing I have always said is: No matter what platform, what OS,
what ANYTHING you use, if it offers everything you need, works well,
and is enjoyable for you, then that's the best OS possible --- for
you. If someone is crusading for the cause of Mint, so what? I've
seen/heard just as many crusading for the cause of Magic. Some would
rather spend a few hours/days/weeks setting up a free or inexpensive
OS than spend a sizable chunk of money to get an OS that doesn't run
all the Internet Apps they want. Others are the opposite and aren't
concerned about the fewer Internet Apps available.

>Open Your eyes and welcome in the real world
>
>Looking forward to yours an other MINT lovers replies.....

Once again, I'm not a "Mint lover", just someone wanting a little
more peace among the few of us Atari owners left before we all get
fed up with the arguing and leave altogether.

2094. Problems with TT and hddriver 7.6

Newsgroup: comp.sys.atari.st
Date: 1999-02-01 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <7938jatcb1@athena.netset.com>
Source record: 85288

I've just discovered that I've got a nasty problem. Question is,
has anyone else experienced this. And if so what is the solution?

Recently I upgraded to Hddriver 7.6 from 7.1, I usually run in
Magic so I didn't notice the problem right away. What happened was this.
I needed to test some files under plain old normal TOS. Used to be able
to do this no problem. However now. Boom! Just as the AE

S is initializing, I get a couple of alerts stating that there isn't
enough window memory and that's it. I've tried disabling the auto folder
and all the .ACC's and it still happens. If I hold control down during
boot I do get to ST Low, but I can not change resolution or the same
problem occurs.

I've looked in the Hddriver utility program and there was nothing
odd set.

For those of you desiring more data on my machine ;)

TT030 4 megs ST RAM 16 megs TT RAM and TOS 3.06.
All drives are connected to the SCSI Bus.

Any ideas or help would be greatly appreciated.

Dan Ackerman
aka baldrick@netset.com

>misbehaving application there by selecting it and pressing
>delete. Regards, Joost.

Thanks for the two similar replies. It does not exist in the program manager.
It doesn't exist anywhere. It was really quite interesting. Shut off the computer
cold boots, everything and each time I actually tried to do a system shut
down it would flag the message that the program was still active.

There isn't a hint of this program anywhere, unless you believe MAGIC:-).

SOLUTION!

Well here is what I did.

Exit Magic via XBOOT and RUN TOS 1.0
After shutting down the computer and then rerunning MAGIC my invisible enemy
had dissapeared.

STrange but true.

Thanks again for your help.

I used Warp 9 when my falcon was running, and it just blanks the
screen, never had any troubles with it and other programs.

2098. TT for sale (USA)

Newsgroup: comp.sys.atari.st
Date: 1999-02-01 00:00:00 UTC
From: Dan Phillips <xiting@worldnet.att.net>
Message-ID: <36B535D9.484A@worldnet.att.net>
Source record: 85292
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Still trying to sell the TT system. I have an offer, but this system is
easily worth $500.

TT system: $500

TT030 10/16
48 MHz CaTTamaran
Nova ET4000 1 meg card w/ v2.08 drivers (fitted inside TT, up to
800X600X32K) 40 MHz FPU (Motorola never supported over 32 MHz
officially in PLCC, but my distributor got one from Motorola
that was tested to 40, which I needed to get the CaTT stable)
TOS 3.06
HD floppy
External Quantum 340 LPS drive

You can't put a hard drive in the TT case because the stock power
supply can't handle the accelerator, RAM, Nova, and a hard drive. The
back of
the case isn't perfect (the fan slots have been opened to a hole to
increase air flow and the video card mount is functional, but not
perfectly clean).

Calamus SL98, ExtenDOS Pro 2.4b, NVDI 4.11, ScanX, Outline Art,
Stalker 3, and much more software would go with the system.

2099. Gemboy: Atari ST Gameboy Emulator.

Newsgroup: comp.sys.atari.st
Date: 1999-02-01 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <793ivq$8cg@james.hwcn.org>
Source record: 85293

Hey gang! Remember a while ago I was asking if anyone had made a Gameboy emulator for the Atari ST? Well I was just reading that an Atari ST programming group from Sweden called "T.O.Y.S." is/was working on on called GEMBOY that will run on everything from a 520ST to a Falcon.

Has anyone else here heard about this? Has this project been completed? Is there anywhere on the internet when I can find a version of this? Is there a webpage for this group? Any "T.O.Y.S." members on this newsgroup that can enlighten us? I think this would be so cool to have. Hardware wise the Gameboy is a pretty simple little machine, it shouldn't be too hard for the ST to emulate it.

Incidently, during the previous discussion someone asked me about a gameboy emulator for the 286. I found it today. It's the NoCa$H Gameboy Emulator. There's a version that will even run on an 8088! Wow!

Also on the subject of Gameboys...

Having become recently addicted to Pokemon I've been contemplating coming up with some sort of way to trade and fight Pokemon with other people around the world (esp. my friend in Japan). I've been thinking if you can make a cable that goes from the GameLink port to a computer then have the computer pump that data through the modem so you can GameLink with anyone with a similarily equiped computer.

I found the schematics for a very simple device to hook a Gameboy's GameLink port to a paralell interface and was wondering if this would work with the Atari ST?

Here's the schematic.

http://fly.hiwaay.net/~jfrohwei/gameboy/gb2pp7.gif

Appearently the ST's Parallel port is not 100% compatable with the PC Parallel port, but will this interface still work? Of course this still leaves the matter of software to send the GameLink data to the modem. That'll have to be written as I don't think there is anything out there to accomplish this task. The software should also include the ability to type text messages back and forth to co-ordinate game operations and just generally chat/taunt/plead-for-mercy with your opponent.

If this won't work, would it be possible to modify this GameLink interface to connect to the ST's MIDI ports instead. This might be even better since there's already software for sending midiport data through to the modem as well as allowing text chatting. I think the program is called MIDITERM. I'm not too certain, it's been a long time since I last used it. It only went up to 2400 baud too which made the timing kind of sloppy and

it was impractical for multi-channel midi transfers (although it would
do them). Did they ever make an improved version that would handle up
to 14.4K? Also, is there a program similar to MIDITERM for the PC that
sends the data in a form compatable with MIDITERM so an ST user can
play a PC user's synths over the phoneline and vice versa?

Thanks, sure enough I found this in the manual on P28. Now compared to the
manual that came with Geneva, I find this manual lacking, so with so few
pages to read, I still miss what I am looking for:-). Besides I am trying
to learn both programs at once so I have just had my head buried in the
books between the two. Anyways, this will solve the problem when some of the
older programs crash as I determine if they are magic friendly or not.
I have a few more questions on Magic, but they will have to wait.
I may be in Calgary in June for the Canadian Superbike Championship.
I will try to remember there are Atari Users there.

Later Brian.

>(preferably around Fredericton) who could help me out?
>Thanks,
>Michael

Ok, The FM was more stable than my 520ST with external drives. However here
are a few basic things to check for.

1) Some (many Canadian) 520STFM were single sided drives.
2) Open your computer and check drive belt to see if it is still connected.
3) Your drive may be out of alignment and any shop can fix this.
4) Sometimes the ST chips get loose and must be RESEATED. Take the cover off
and for good measure just start pushing all the chips in tight. (This is comon
for many STs and MINE IN PARTICULAR. I have 3 520STs which I have to do this
to on a regular basis to get the drives to read.

Well, thats all that comes to mind.

Minimum bid is $1, no reserve. For a picture or to bid:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=62830613

This computer system has been tested and works. It is an Atari 1040 ST with a built in 3.5" disk drive, an Atari mouse, 92 page Owner's Manual, and the power cable. This system requires an Atari ST monitor. If you need one please check my other auctions as I have one available. Also included is a bundle of original games and applications. I tested a few of them and they worked fine, but I did not test them all so the software is sold as-is. Here is a list of the titles:

10th Frame
Airball
Antic: Maps and Legends, Cartographer
Arcticfox
Athena II (CAD) w/300 page manual
Barbarian w/manual
California Games
Carrier Command
Championship Wrestling w/manual
Cybermate
Dungeon Master w/manual
Final Assault
GBA Championship Basketball w/manual
GFL Championship Football w/manual
Gone Fishï¿½n w/manual
Gridiron: Football Simulator
Gunship
High Roller w/manual
Home Accountant w/manual
Hostage Rescue Mission (Disk 2 only) w/manual
Hunt for Red October w/manual
Jack Nicklaus Greatest 18 Holes of Major
Championship Golf w/manual
Karate Kid Part II
Leader Board w/manual
Leatherneck
Leisure Suit Larry II
Letï¿½s Make Greeting Cards
Marble Madness (Disk 2 only)
Match Point
Micro League Baseball w/manual
Micro League Baseball II
Micro League Wrestling w/manual

Paradox
Police Quest w/reference cards
Power Drift
Roller Coaster Rumbler w/manual
Sim City
Speedball
ST Express V2 #3
Star Trek: The Rebel Universe
STart Special Issue #2
STart V3 #1
Sub Battle Simulator
Super Cycle
Superstar Ice Hockey w/manual
Terrorpods
Test Drive (Disk 2 only)
Their Finest Hour
TV Sports Football w/manual
War in Middle Earth
Winter Games w/manual
World Games w/manual
Xevious

wrong, this is java, not javascript.
Yes, java as in the java language.

> I don't really know what micq is (I'm not a MINT adept) but I gues it's some
> kind of IRC client, if this is so. Well no problem here either, this is a
> job for STING and it runs just as well under MagiC.
Not quite. micq is an icq client.
icq is an internet pager.
More info, use your www browser on yahoo.

> BTW: when I asked for applications I ment real life applications, like DTP,
> Database and Spreadsheet applications, Graphics processing etc...
everything that runs in magic, it will run in MiNT, so. no need to talk
about standard applications.

> Don't tell me that You and all the other "misleaded" went through all that
> trouble just to run a couple of PD/shareware utilities ????
putting down shareware?
don't trust shareware quality?
Because it's shareware/PD, it is not quality?
hmm rethink that please.

> While on the subject I haven't seen any of the other "STARS" ported over

> available for the MINT/NAES platform I will THROW MagiC out and become a
> "believer" also.
1) it's GIMP. unless there's a new soft called GLIMP.
2) you are talking about X applications, so, if you have mint with X
installed, yes, I guess you could port them. But well. STAR office versus
Papyrus 7.x as of today directly in the AES. I wonder.

Word perfect has free src now? I didnt know. my bad.

>
> Open Your eyes and welcome in the real world
Well, how about you get more information before guessing things you don't know for sure?
How about this fact on my falcon:
aniplayer being developed on magic:
faster in MiNT than in magic.
Just a simple example. Same config. just different OS.
I guess you thought MiNT was slow, right?

If you don't believe this fact. oh well, hard to prove it. I invite you here, that'll be quite a shock.

oups, uptime for tonight?
cut and paste into pine:
3:32am up 7:22, 2 users, load average: 0.67, 0.42, 0.33
there. getting ready to switch the computer off.
magic 4.x until version 6 can't hold that long for what I do.
to me, rebooting every 5 min, not beeing sure if I saved my work on time is NO fun.
But well, let's not bash on magic.
Or let's not start another OS war.
We are all on atari after all.

>
> Looking forward to yours an other MINT lovers replies.....
MiNT "lovers", hmm not especially lovers, That's what we have best to far, so I need to use that.
Got my reply.

PS:
This war thing is starting to piss me off.
Magic users are so blind. All MiNT users I know at least have tried magic.
not the opposite unfortunately. You would think the opposite hey? coz one is free, the other one not.
Oh well.

btw, I have a falcon. That might explain why magic is so unstable not even funny.

/
MiNT Is Now TOS, let's move on, shall we? /

I recently copied some offline html's into a folder called "HTML docs".
Whilst CAB2.7 was quite happy looking at the files within, Everest had a
problem with it and opened two windows, one entitled HTML and the other
docs. (Everest installed as source viewer and OLGA server). Renaming with an
underscore cured the problem.

Thanks for the explanation Thomas.

Of course we are :)
Let me tell from where I come from:
-TOS 1.0
-TOS 1.0 with Neodesk
-TOS 1.4 with Neodesk
-TOS 2.6 with Geneva Neodesk
-TOS 3.06 with Geneva Neodesk
-TOS 3.06 with MintNet Geneva Neodesk
-TOS 3.06 with MagiC! and MagiCdesk with StinG
-TOS 3.06 with MagiC! and Thing with STinG
-and now I'm wondering if I will or not buy this exceptionnal
alternative deskop Jinnee ...

No Martin ! Don't speak me now about NAES ;)

Where will this stops ?

And I must admit I now have abandonned MintNet at this time ...

:-(Sounds as though the read/write heads have broken. It could also
be the WD1772 controller chip.

Is there any chance you can substitute your FDD into an ST which is
known to be working to ckeck whether drive or chip is faulty?

I guess you should be looking for another drive, though.

> configure HS-Modem properly, well thank�s anyway.

Hi J�rgen,

I didn't have any trouble using the new HSmodem drivers on my Milan.
I have drvin.prg and then mfp_mila.prg, uart_2f8.prg and
uart_3f8.prg, sitting in my Auto-folder after mintnp.prg and before
sting.prg. I have disabled mfp_mila.prg, because it doesn't work very
well together with the other two (remember they are still betas).
In my experience, the Milan's serial.cpx doesn't work very easy with
these two new drivers. So I'm using Sting's serial.cpx.
To configure the drivers you need setter.tos, as in the origional HS-
Modem7 distribution. But I've found out there isn't much sensible to
change exept for the buffers.

Hope this helps!

>And I must admit I now have abandonned MintNet at this time ...

And why did you leave MiNTnet? Can it be that MiNT/MiNTnet/Geneva/Neodesk
was a little bit unstable? Sure Geneva/Nedesk is stable although I never
got it working properly but I saw on many occassions that Geneva/Neodesk
worked very well for you. Unfortunately when one run MiNT on top of this
combo it isn't that stable anymore. I really can't blame you leaving
MiNTnet. If I was in your place I probably should do the same.

I think you surely will admit that you were online long before others
could do the same using STing/STik and that thanks to MiNT/Mintnet.

Whatever some people thinks about me I'm really not a MagiC hater. I only
hate the way ASH is doing business nowadays. Furthermore I don't like the
idea that I must have two copies of MagiC in order to use it on my
machines. For the Hades060 I need a special and expencive version that
probably won't run on my TT030.
I like to have an OS that runs on every machine be it a modest Mega ST or
the latest Milan and that is something MagiC can't do.

The UTSI has that link indeed. Just follow utility/divers link.
The UTSI URL can you find in my sign off.

There is another screensaver that might help you. SCHON_ME was until
recently shareware but right now the author has put it into freeware. The
registration key is listed on his page.
The right URL is also listed on the UTSI but this time on the
uitlity/desktop link.
You can find SCHON_ME on the Belgian ftp-site 193.190.205.13
/atari/incoming/utilities/shme_22.lzh. Be aware though that this archive
doesn't include the registration key for the moment. You must visite the
homepage of Richard Gordon Faika to get that key.
I'll upload ASAP that key to the Belgian site.

So far I only had only major prob with SCHON_ME. If one is printing with
Calamus SL 98 (maybe older version too) whilst the screensaver comes up
then one will notice that the cursor is gone. Beeing so it's impossible to
quit the print window. The only remedie (I know) is a reboot.

Hope this help

>linelength -))

[SNAP]

Went shopping, found a scsi external CD ROM (complete including
case+cables) for approx. 75 Euro's. Salesman warned me: might take
you a few hours to get the termination right. After connecting the
drive to the scsi port (TT030) I started id-test.prg. It seems to
be a Toshiba XM 3801TA1047. The address: SCSCI 3 ! ;-) Went to the
net and picked up spin034.tos and cdplayer. Changed config.sys:
; CD-ROMs SCSI 3 (8 + 3 = 11)
*BOS, c:\auto\spin_sd.bos, A:11
; as logical drive S:
*DOS, c:\auto\iso9660f.dos, S:A
placed it together with spin_sb.bos, scsidrv.prx and metaxbs.prg in
the AUTO folder. Finally spinmagc.xfs in the
c:\gemsys\magic\extension folder and a reboot!

Eureka: lucky me it, works. All in less than half an hour! :-))
A can even play and record audio cd :-) thanks to SPIN by Julian
Reschke and the cdplayer by Alexander Clauss

Oops now I need a Gigabyte HD for audio recording ;-)

The fact I've bought me an expencive machine has nothing to do
with the fact I refuse to buy an OS that only will work on my
Hades. That's really a wast of money. Would you buy two versions of
an OS just because the basic version refuse to work on one of
the machines? I doubt that.

The reason why I bought me a Hades is very easy. I wanted a true
TOS machine and not some kind of emulator with which you've more
trouble then joy. Have you ever tried to print a Calamus document
on a Mac running MagicMac? Joy it is. It takes some three (3)
minutes to print out *one* single text-only doc in 600 DPI on a HP
laserjet 5 (pc-model). Even a ST will perform better.
On my Hades it's printed out before you know. It's so fast that if
I want to print on both sides I must switch off the automatic
paperfeed otherwise before I can turn the page the printer has
took another one from the tray.

Unsupported??. The Hades is still alive only Fredi Ashwanden seems
to be not very co-operative at least not for non-German speaking
people. Do you know he is working right now on a driver for the
ATI Rage graphic cards? When this will be finished we will have a
very quick card indeed.

I am using Geneva on a TT (just so you know my limited history) and have been following the MINT discussion for years, without ever trying to use MINT myself.

I have some questions about MINT. I get the impression it is sort of a UNIX for the Atari. If you want UNIX, why not just get a PC or a MAC for UNIX. The PC and MAC hardware seems a lot faster for a given amount of money than any Atari. I can't see any advantage to an Atari for UNIX unless you are ALSO using the Atari for MIDI. Can someone tell me why a PC or MAC isn't the best hardware to run UNIX?

From: flipflap@coastalnet.com
Message-ID: <4xJt2.86$Qd4.256@news15.ispnews.com>
Source record: 85073

I have a MAC 630CD with an LC68040 at 33/66mhz. Is this as fast as a Power MAC for running MagicMac? I thought it might be, since it probably has to do less work to emulate the 68xxx processors used by Atari.

I have the demo installed and it seems to handle most of my usual applications. dBMAN is my most critical app and it seems OK on the demo. I assume if it works on the demo it must be good on the full version.

Another question on printing from MagicMac. Is it best to print via a genuine MAC compatible printer, or best to use the $100 program and special cable required to adapt a PC printer to a MAC? I don't remember the name, Print Master or something like that. Seems like I heard that the Atari programs output better to an Epson compatible than to a MAC printer.

Bill Freeman

2132. AixiTT card and Emagic Logic

Newsgroup: comp.sys.atari.st
Date: 1999-02-02 00:00:00 UTC
From: jperez@Hawaii.Edu
Message-ID: <797or9$rra@news.Hawaii.Edu>
Source record: 85076

Greetings,

I recently put an AixiTT ram card in my TT, and fitted it with
64meg of Ram. Now Emagic Logic 2.5 does not function properly - either
the cartridge key/dongle (Log3 Interface) is not visible, or when the
program does load, MIDI information gets scrambled. If I put my 4 meg TT
ram board back - everything works again.

Any ideas?

Aloha,
John Perez - jperez@hawaii.edu

```
MiNT is not Unix, is a multitasking TOS-compatible kernel, which can be made
to look a lot like Unix if you team it up with a minix filesystem and shell.

In other words, you can have the advantages of TOS and Unix in one system.

I also have the aixiTT board with 64meg of ram on it. I don't have
the software you have, nor have I noticed any program fail since
installing the card. You could check to see if the program's header
flags are set to run in TTram or allocate TTram and change them if
they are. Some programs internally use fastram so that may not have
any effect, depends on the age of the program in question. Hope this
helps you...

2142. Atari to DOS Hard Drive Partitions

Newsgroup: comp.sys.atari.st
Date: 1999-02-02 00:00:00 UTC
From: Don Bacon <dbacon@ford.com>
Message-ID: <36B7207F.D3494006@ford.com>
Source record: 85086

Does anybody know if it is possible to directly attach a SCSI drive
partitioned for the Atari onto a DOS computer SCSI chain, or the other
way about. I am hoping to move a drive along with all it's data directly
between machines rather than through Modems, RS232, Floppy disks etc.

Best regards
Don

2145. Notator SL manual

Newsgroup: comp.sys.atari.st
Date: 1999-02-02 00:00:00 UTC
From: sunset
Message-ID: <795fhp$820@enews1.newsguy.com>
Source record: 85190

I've lost my Notator SL manual part 1, and Emagic won't even reply back through email for anything concerning Notator. Would it be possible for a Notator support group to scan the manuals and upload them to a support site for reference since apparently Emagic doesn't seem to want to have anything to do with Notator? Or would this majorly violate the copy right laws and Emagic would sue the support group to death for a product they won't even recognize?

thanks

U > You can't write to SCSI maintenance tracks.

(long question, with explanations, background, and assorted comments follows)

When I was first fighting with my HP 'Coyote' 1.2G drive, several years ago, I was emailed by a fellow (ex-Atarian who occasionally reads this ng) who had worked at HP on the Coyote software. He tried to help me with it. IIRC, he paraphrased an American writer thus: 'he who likes sausage, loves the law, and uses hard drives+software should never watch any of these being made'. According to him, there is a lot of voodoo involved. It was he who suggested that when ICD tried and failed to log the bad sectors, it was trying to access the maintenance tracks, where the factory bad sectors log was kept. He also asked whether I had any soft that would deliver certain scsi commands. Since I couldn't find what he suggested, I gave up and mapped the bad sectors to the FATs, and it has worked well ever since.

I will of course take your word as gospel, Dr. Siemet. But my question is about your last statement. Do you mean that 'writing to maintenance tracks' is impossible in an absolute sense, impossible on an Atari, or the software just doesn't exist or is too risky, or what?

Mostly curiosity, but anytime that you will take the time to enlighten me/us, I/we are richer in understanding.

> users know about it. What's the big Secret ? Who ported Java to Mint ?

The free JVM "Kaffe" was ported to MiNT (for some unknown reason it
doesn't work with plain TOS) almost a year ago by Axel Kaiser (IIRC).
The reasons why this isn't *the* big thing today are simple:

* It's so big and slow it's practically unusable (and Kaffe is one of
the better JVMs!).
* AWT is not ported, so you can only write text-only apps with it.
* Java itself is nothing to get exited about (flame me if you want).

If you want to know more about Java (Kaffe) on MiNT search for it on
Alta Vista.

> to do. How many MB do you need to install? Is a harddisk of 270Mb
enough ? can I still use my TT or do I need to upgrade to a clone?
Will my 36Mb > memory be enough or do I need the new 128Mb Axit card?

A TT with 36Mb is just enough to run "Hello world". It takes a minute
to compile (Kaffe has a JIT compiler) and five seconds to execute
though. Yes, "Hello world" takes five seconds on a TT, even with the
relatively efficient 68k JIT in Kaffe.

Has someone already > developed applications with it? Can pigs fly ?

Yes, pigs can fly, I've seen it myself many times. They usually swarm
late Friday and Saturday night, just when I'm walking home from a
party.

pine, tin, mutt, mc, NcFTP, lynx, micq, telnet, archie and ircII are
ten fairly well-known internet-apps that only will work with MiNT and
MiNTnet. But these are perhaps not "real" applications...

There are ofcourse a variety of programming-languages (like the
previously mentioned (unusable) Java) ported to MiNT, databases (mSQL,
the only client<->server SQL database for our platform), spreadsheets,
text-processing tools etc. available. And some client/server software
that allows your Atari to blend smoothly in a unix- or
Windows-network.

Yes, as I said, if you run MagiC all the time then this is not a
problem. It's a big problem if you use more than one OS (which I do).

> Thing probably is the best desktop running under MINT/NAES. But it is
> out of his league against Jinnee under MagiC. It will take more then one

> NVDI, Texel, Signum, Scripter, ASH Emailer etc....

Are any of these developed in-house? And except ASH Emailer, does any
of these *require* MagiC as ASH marketing says?

> Like it or not but ASH is the biggest player in our small market, if they
> close the Atari era then things would really look bad. Lets face it, what
> is left ?? Not a lot ... Papyrus, Calamus and a few others

Developers and publishers are not the same thing. Without ASH,
somebody else could publish MagiC, Jinnee, CAB, Artworks, Papillon,
Phoenix, NVDI, Texel, Signum, Scripter etc.

I wonder why... ASH Emailer is rather braindead in this respect,
instead of checking for the necessary functionality it simply assumes
that only MagiC can provide it.

> ftp://ftp.lip6.fr/pub/atari/news download the Jaguar Developers Kit
> and try to run it.

A JDK that requires MagiC? Have you tried Il Profesore's "Code" for
MiNT?

theory both could be adapted to run on MINT/NAES though I would
> like to see the day...

It will never happen, it's just not worth the effort to port it to
another GUI. Our Ataris are currently too slow and has too little RAM
(well, I have 64Mb but even that will be cramped) to cope with another
layer of GUI-code on top of the already existing code in these bloated
apps.

> BTW what is Papyrus doing in this discussion, don't tell me you're a Papyrus

I'm rather pleased with papyrus on my Falcon/AB/Nova, but then I'm
using Word at work...

~^~^~^

A friend of mine had a cat who got a little over excited by his Ensoniq
Mirage sampler and sprayed all over the thing. I got the task of repairing
it. I had to actually remove the motherboard and stick it in a tub of
soapy water several times to remove all the cat-goo. The keyboard required
a similar treatment as did the machine's case itself. It still has that
faint wiff of cat-goo to it and its been a few years. The mirage
works fine as a synth module now but the chip that reads the keyboard
was fried and is no longer in production.

The cat is still alive although he no longer has testicles.

CRACKERS

Hello,

Have you tried to change the SCSI ID number of the drives. Make sure
that they are not the same. There is usually a set of jumper pins,
|::::|, that will change the ID. They usually at the back of most
drives. Megaflie 30 may have a set of dip switches that change the
drive ID.

Howard

Message-ID: <79b8n4$4jf@newsops.execpc.com>
Source record: 84962

Hi,

I would like to know if there is a screen accelerator that will
work with Notator SL and Logic 2.5

Maccel3 seems to work so far. But thats just for the mouse.

I have heard of NVDI.
Does this have to be run in conjunction with MagiC?

Would MagiC increase the speed of the program.
(Like, when I scroll text for editing)

I am running it on an STE 4meg TOS 2.06

Any suggestions would be aprreciated.

ken

> and try to run it.
> I'll accept a cheque-))

Ok, :))) listen to this one then :)
I DID go on lib6 and got the dev :)

1) yo are talking about specific software. so, DUH! just like me saying:
MiNTsetter won't work in Magic. Of course it won't. coz I check the cookie
and abort the loading (afaik magic doesn't support Ssystem()).
Or like, hey magic sucks coz taskbar doesn't work. OF course it doesn't.
coz it was made for 1 OS. for whatever reason. (in example using less cpu
time coz it directly uses extended calls of naes, which magic aes doesn't
have afaik). So this is pointless.
I thought you would be mentioning a program that is not OS related.

Now:
I got the package.
Ran it, of course, it checked for magic. (heheh magic 4 from what the
alert said won't even work!, need version 5.x at least), so magic
compatible, but ONLY latest.

Is it to force magic 4.x users to upgrade?

Anyway, it checks for the cookie "MagX", no big deal, I want to see what
really makes it magic only program, the author must have his reason. Like
using magic shared libs.

So no big deal, I make a backup copy of the app. And edit the program
itself to run it under MiNT.
(bin editor, changed MagX into MiNT).
Try to run it from MiNT, it works.
Try messing around, few min later it locks.
hmm ok, that must be a reason why it was only magic compatible. probably
calling a fonction (not checking if OS supported it of course) that is not
present in MiNT. Ok fair enough. it actually uses some extended calls,
that's why it locks. Or maybe coz I don't have a jaguar connected to my

falcon.

I reboot now into magic 6.
Load jaguar.app again (the original, not the MiNT edited one)
And boom :) same crash at same place.

How to recreate the crash: highlight an icon in the bar, then click on
desktop. then click on desktop a second time. It should crash :)

No further comments about the jag kit.
You chose a bad example. I proved you it ran as good/bad under magic than
under MiNT.
I do accept checks. Thanks.. (geez, easy money)

Also, I didn't know that menu_register() was any different under magic
than MiNT. Can anyone confirm that? Is it supposed to be the same call?

> Atari community surely was completely gone. For exemple: recently I downloaded

> job better, faster is more flexible.... out it goes.

Ok, I don't think you really understood what it was all about.
Please, oh please, tell me how you convert a JPG into a 16 col grayscale
GIF scaled down with a factor of 1/4th with IMAGECOPY.
I am very curious.
If you tell me how to do that with your "commercial" software (which btw
is a very good viewer), I will apologize.

Oh so a magic-mac user on macintosh is an atari user?
So, basically, a Sinclair emulator on my falcon makes me a Sinclair user?
Ok for this concept, needless to say I would not agree with you here.
A mac user running magicmac is still a mac user.
A pc user running magicpc is still a pc user.

An atari running spectre GCR is still an atari user.

HELP!! I dragged my atari 1040F out of the garage. I know nothing about it. It boots right now to a green screnn with Floppy disk A and Floppy Disk B and Trash on it. I dont know if it has a hard drive, and I dont know what kinds of disks it uses, I dont know how much memory it has, blah blah blah. It has a mouse and a joystick and a monitor hooked to it. Does anyone know:
A - what kind of disks it uses
B - where I can get said disks
C - If and how I can run a system diagnostic
D - Where I can get applications, etc
E - Where I can get a compiler (BASIC or C preferable, PASCAL if necessary)

Id really like to sstart using it again. Ive decided to take on the ambitions goal of writing a program to make it communicate over some port or other with a PC running Linux. I can write the software If I get a compiler and learn the system basics I think, but I have no manual. The only surviving manual I have is for Mark Willams' C and I dont have the disk. Please help!!
Thanx a million,
Jon Striley

Is'nt this the most important thing.
Let this be true forever.
At least you have a choice. As long as MagiC and Mint/NAES are not fighting each other on the interfaces, everybody should be happy.

But ASH now sell's both a OS and apps; Lets hope they dont develop into a nanosoft corporation.

Henk.

It's "Power Print" and I use it from my G3 every day. It's faster in Atari
than on the Mac and I'm convinced in the difference between their drivers or
the way Atari sends data to the printer. Same printer (Brother HL660) takes
3x as long to print from Mac as from Papyrus/Calamus/Photoline etc.

Ofcourse, it's just that Thing is a lot cheaper, has a lot of useful
features and works equally well under Geneva, N.AES, TOS, MultiTOS and
MagiC, while Jinnee costs big $$ and only works reliably under MagiC.
Ofcourse, if you run MagiC all the time then this is not a problem
(except the $$ ofcourse).

>Bill Gates has given us a fantastic wordprocessor

Hello Jos,

Have You heard Of TEMPUS WORD PRO copyright 1989 ?? I suggest You take
a look at it......-)))))
This program was ahead of his time with his userinterface and options,
Latest version is 2.92 from 1996 and a version 4.0 is on the way
according to rumours in the German newsgroups.

You don't believe me; try to load a dictionary containing 280000 words
in Papyrus...... make yourself a cup of coffee and if You have a dog
take it for a walk. Now load a 200+ pages doc, do a spelling control on
it and reformat it. Make yourself a can of coffee this time...... I'm not
mentioning the Calamus font support, build in database, options to print
to three printers at once.... and the list goes on because these things
are still not possible with Papyrus.

>I want to get in touch with Papyrus users and perhaps there's someone, >willing to sell
You want Papyrus, If you pay post and packaging I'll send it to You FREE.
I'll be glad it's gone, it's only gathering dust here, version 6.23 can
be upgraded to version 7.and a bit for a very small price. I'll even
include a demoversion of TEMPUS so you can compare.

Cheers from Belgium.

Nick,

BSDi is not Unix
NETbsd is not Unix
Solaris is not Unix
VMS is not Unix
Linux is not Unix
Minix is not Unix
etc etc

What do you mean by Unix?

```
-----------------------------------------
/
MiNT Is Now TOS, let's move on, shall we? /
/

> -TOS 3.06 with MagiC! and Thing with STinG

Yes you did!
And the funny part is that we were talking about OS.
And you, right in the middle is talking about desktops, and/or AES,
Internet stacks.
what's the relation?
oh you forgot to add to your list when you had wdialog, also xcontrol.acc
and few others like that..

> -and now I'm wondering if I will or not buy this exceptionnal
> alternative deskop Jinnee ...

Well, I am sure you will. That's just gonna make your list longer. Coz
right after jinne, you gonna change again, somewhat, you can't find
anything that suits you.

>
> No Martin ! Don't speak me now about NAES ;)
I guess he should. I bet you 30 bucks that you gonna buy jinnee coz the
BEST/Exceptional desktop. But in 4 months, you MIGHT realize that you
don't like it. And the search keeps on again. I bet you even that when you
had once Neodesk/Geneva, you could have sworn it was the best environment
ever, and that magic was not for you.
That's good in a way, That's evolution.
That's not so good in another way because you are denying aggressively

sometimes what's really good.
I bet you even that you'll get a mac or a pc very soon. After all, they are cheap, supported machines and quite fast. No?

> Where will this stops ?
Where? I don't know.
I can tell you one thing though.
If Atari as of today was only ruled by ASH/Magic.
Me, Katherine L. Ellis would quit Atari.

So People like Frank Neuman, Jo Even S, Odd skancke, Draco, Guido Flohr, Lonny Pursell, Thomas Binder and all others I forgot, I must say that the experience is worthwhile. They all contribute into something I believe, we believe.

Now some peeps here, might destroy such a passion with some: "Hey Jinne at least can do background pics", or the like: "Magic supports proportional fonts at least."

What's sad here is a need for the users to lie, or misinform people to promote an OS.
Example of a www page I saw few min ago:
Spin!, CDrom driver for Magic.

Boom, it says it all right there..

BubbleGEM (last time on this very same usenet) needs magic to run.

What the hell is that?

Are those lies? or misinformation?

Call me once again a dreamer, but an overpriced Phenix60 over a cheap 450Pii. Well, I'll put my money (maybe not wise, but I have strong beliefs) on the phenix. We are all marginals here, We don't need to have a super powerstation to run some medical experiments, or work research on fluids, or whatever other scientist job.
Fun is the keyword.
Jo, I DO know you don't have no fun with your atari. hence my bet about you getting another machine quite soon.

Now, you "mocking" Martin about the purchase of an Hades60, I don't get it at all.
1) probably still expensive coz of that kind of remark. This is not helping at all. (oh wait, maybe you are doing it on purpose!? I get it now)
2) That's his choice to put wherever he wants the money for his hobby/passion.
3) back to you. You probably never thought about getting an hades60 coz it didn't run your favorite OS?

all in all, I am curious to know what you "Jo" are gonna do next.
New Desktop? new OS? (oh no, don't want to talk about MiNT/Naes, that's true) New machine perhaps?

Keep me informed.

Thanks, and sorry for this long post.

```

I forgot only one thing : avoiding to try to participate in a
discussion where I have nothing to say because I'm not an OS master.
So, continue to build without me ...

And of course I apologize for my ignorance.

Peace and OS

I had a similar problem with my Syquest EZ135. I left it alone for a few
weeks, tried it again and it worked - and has been perfect since.

I wouldn't mind betting that there's a problem with the power supply tho'.
Check its voltage with the drive switched on.

Personally I like GEM/TOS the best. It comes with my machine for free,
doesn't need extra memory, doesn't need a hard drive, runs all the software
I need it to. And for me, it's multi-tasking. I can run my graphics program
on my ST in the corner of the room, MIDI applications on the ST by my synths,
all while playing Dungeon Master on the ST sitting over there. Now THAT'S
multi-tasking! ;)

What PD/Freeware OS/Desktops are there for a stock 1040ST and where can
they be found. I wouldn't mind checking some of them out even though I
doubt I'd ever give up GEM/TOS.

CRACKERS
(Multi-tasking for $5 a pop from hell!!!!)

2188. 140ST heat problem

Newsgroup: comp.sys.atari.st
Date: 1999-02-03 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <7994rshmt3@news2.xs4all.nl>
Source record: 85103

In reality it was a cat-problem. I explain.

Last week, in a cold period the heating in the house stopped.
The cat became cold.
The 1040 ST was on. Later in the day I came home from the cold.
Found very hot cat draped over 1040 ST.

It looked like as if the cat had done a contr-alt-del: the ST had
gone trough a reset.
Now it happens sometimes that the machine freezes. Looks like the
power supply needs looking after.

Any comment?

Met vriendelijke groet,
Ronald van der Kamp

Keith,

Thanks for the response. On your advice I think I'll buy Power Print for
my BJC-4000 instead of a MAC printer. Do you know if version 3.0
semi-current?

BTW I once had a 62 GT Hawk. My last of a of long line of Studebakers
starting with a '51 Commander Starlight Coupe and including a bunch of
the Loewy coupes. I'm collecting 66-70 Olds Toronados at present.

Livin' in the USA.

Bill,
If you want to ONLY run a Unix like OS (FreeBSD, NetBSD, Linux, Minix etc),
you're right, PCs are cheaper and more powerful. But the most important point
of MiNT (according to me, of course) is that it can run TOS programs and "Unix"
programs AT THE SAME TIME !
You can keep your GEM software (specific to Atari), and use things from various
other systems (Linux, etc). As an exemple, you can use Elm, Pine, shells like
Tcsh, Bash. Programs from Linux etc can be easily ported to MiNT (networking
software, programming tools (gcc), etc etc).
That's why MiNT is great. 2 Operating Systems in one :)

I have to admit that I have a P2@450Mhz/NT right next to my Falcon.
Let me see, when was the last time I used that PC? IIRC I copied some
CDs a couple of weeks ago, and I used it for a Shockwave-project two
months ago...

All that raw CPU-power and huge selection of apps sitting on my
desktop, and I'm still using my Falcon for almost everything I do. I
must be mad...

And at work I have a similar PC, but with a 21" Panasonic monitor. But
if my boss would have permitted it I would have hooked up my TT to
that monitor to get some real work done.

Btw. the PC excels in one thing: Emulating old and obsolete 8-bit
systems...

A plain ST with only 1Mb? Not much I'm afraid, you can get MultiTOS
and Thing running but then there's no RAM left for apps...

If you only need a new desktop then Teradesk is the best choice for
1Mb-machines.

Hi Bill, how ya doin'? Hope I can help here a bit. I know its confusing if you've not seen MINT running on a properly setup TOS machine...

Imagine UNIX (and its not really "Unix" here, but a nice kernel, supporting filesystem, etc) sitting in your basement (low level). Now, on top of that, software like N.aes and Thing "sit" as a top floor (layer). If you didn't know that I was using MINT, when you looked at my desktop, you would think I had a standard Falcon running Thing as an alternative desktop. I can get to a command line prompt (what most people seem to expect from "Unix") by pressing the <alt><F1-F9> keys. Each one of these <alt> combinations gives me access to a virtual desktop, where I can issue commands. <alt><F10> just returns me to my oh-so-familiar GEM desktop, (Thing v1.27e). SO whats the advantage to this? Well, of the multitasking systems I've personally used, (Neodesk/Geneva, Multitos), its by far the fastest and most stable. Its easily the most flexible as well. I've got all my favorite TOS apps and programs, just like I've always had, as well as software ports from the Unix world, such as Micq. (I know this one program gets mentioned a lot, but it is an excellant example-among many, such as Pine, Tin, IrcII, Emacs, etc,...)

So, on a typical day, using my Falcon, logging on to the 'Net, using CAB, Newsie, AtarIRC, logging off, editing some text files with QED, running some excellant demos like Dream Dimension, or Reservoir Gods games, or viewing some anims with Aniplayer, or just whatever I would normally do on a singleTOS Falcon, and I have never seen anything resembling "Unix" unless I choose... ;-)

Want a summary? MINT gives me the best multitasking "foundation" to run my TOS desktop/software on...IMHO.

I hope this helps a bit...!

->Falcon 14 meg
->.

Hi Bill. Hmm...I installed KEMD R2 on my Falcon, and I did not have to use the floppy. I put everything in a folder "KEMD" on my D: drive with H: as my target Minix drive. After I put all those files in KEMD, it was a little over 12 megs in size (everything but Xwindows). It ran fine there.

We need a little more information though. What HD software are you using? If you are using ICD's software, your target Minix partition can NOT be over 64 megs in size.

Also, as per the docs, only attempt this installation from a very "clean" bootup, i.e., no ACCs/CPXs running, and empty AUTO and MULTITOS folders on your C: drive...

Keep plugging away at it, and ask questions as needed. Also, E-mail me if you need to. If you live in the USA I don't care a bit to go "voice" with you to help you as much as I can... ;-)

See ya!

No, but it's faster as any original Atari hardware.

If you like it realy fast -> G3/300
Do not change/compare 68K Mac with any PPC Mac..
PPC speed is to much different and the fastest what i ever see'n
(Nobody build's faster atari hardware) ;-)

> I have the demo installed and it seems to handle most of my usual

Yes, MagiCMac is very compatible and usefull, also expensiv.
Normal applications are fine, forgot atari games.
dBMan, i don't know, i doasn't have it.

> Another question on printing from MagicMac. Is it best to print via a

> special cable required to adapt a PC printer to a MAC? I don't remember
> the name, Print Master or something like that. Seems like I heard that
> the Atari programs output better to an Epson compatible than to a MAC

The best way is to use the pinter do you have, sure, most of them doasn't
have an serial port. I take a second hand "PowerPrint"

Nice handling. I use the same printer (HP660c) for Atari and Mac.
PowerPrint comes with a LOT of printer drivers, easy to install.

Right, watch out if you buy a new printer!!
Bullshit "WIN '98 compatible" printers doasn't work on any Atari!
Ask the dealer for "Epson compatible"
If the dealer doasn't know what that means, change the dealer quick :->

Printer output is same with PowerPrint on Mac (better!) as with Atari.
(NVDI5 allowed 300dpi, PowerPrint 600dpi)

2213. Touchup-problem with arrows

Newsgroup: comp.sys.atari.st
Date: 1999-02-03 00:00:00 UTC
From: Alyre Chiasson <chiassa@umoncton.ca>
Message-ID: <36B89941.F72DDA98@umoncton.ca>
Source record: 85128

Hi,

I would like to draw lines with arrows as the end point. After selecting arrows as the endpoint from the icon menu what I get looks like a magnification of the arrow itself. There is no line drawn just a stretched out arrowhead. Seems like a problem with resolution but the result is the same at either a low resolution like 98 dpi or 300 dpi. I would rather use 300 dpi because it matches my printer resolution. How do I get draw a line with an arrowhead at the end?

<----------->
Thanks

Katherine wrote;

>everything that runs in magic, it will run in MiNT,

Try ASH Emailer, I'll bet you $30 it will NOT run...
Oh, I forget you don't run ASH software on your computer, well,
it doesn't matter there are several more examples:
ftp://ftp.lip6.fr/pub/atari/news download the Jaguar Developers Kit
and try to run it.
I'll accept a cheque-))

>How about this fact on my falcon:
>aniplayer being developed on magic:
>faster in MiNT than in magic.

I wouldn't know, I use a graphic card and I'm quit pleased with the outcome

How about this fact on my TT:
Mplayer being developed on I don't know what:
much faster then aniplayer

>putting down shareware? don't trust shareware quality?
>Because it's shareware/PD, it is not quality?
>hmm rethink that please.

Don't put words in my mouth, I might just start to talk. When I take a look
at what is running here at the moment, well most of it is shareware/PD. I'm
not gonna make the mistake that JO made and sum them all up-).
It is not a matter of trust nor has it got anything to do with a lack of
quality. For me its a matter of taste and being functional. I used Gemview for
over a year, always been happy with it, until IMAGECOPY moved in. Out was
Gemview, I'm not saying Gemview is no good, what I'm saying is that IMAGECOPY
covers my needs a lot better. This is one example, I could give You a dozen
like these. The fact that PD is free and shareware is usally cheaper then the
commercial counterpart doesn't mean it's a hallmark for quality. I appreciate
the work that many people who write PD/Shareware put in, without them the
Atari community surely was completely gone. For exemple: recently I downloaded
JPEGEM which if I'm not mistaken is written by You. Well, I started it up, and
tried it out. Seen it tested it and out it went, why? it does everything you
described it would do, but so does ImageCopy and it does it faster and gives me
more control. Now if didn't had ImageCopy I surely would use your program and
would be very happy that someone took the trouble to write it. This covers the story. I
like PD/Shareware but if I can replace it with something that does the
job better, faster is more flexible.... out it goes.

>STAR office versus Papyrus 7.x as of today directly in the AES.
I never said that Star Office is available for the Atariplatform. I reacted to

Martin saying NETSCAPE was coming. Well they both put their sources up for free, and in theory both could be adapted to run on MINT/NAES though I would like to see the day...
BTW what is Papyrus doing in this discussion, don't tell me you're a Papyrus fan also. This Word Processor is sluggish, has a clumsy interface and slows one down instead of making the job easier. For more comments see my other posting about Papyrus

>Magic users are so blind.
According to the doctor my eyesight is OK

>I have a falcon. That might explain why magic is so unstable not even
>funny.

MagiC is stable on a lot of Falcons. I think yours need a checkup. Or perhaps it's a special model: made on a mondaymorning for MINT fanatics so they've a reason to explain why they need to run MINT

>---
> /
>MiNT Is Now TOS, let's move on, shall we? /

>(except the $$ ofcourse).

Thing costs 30DM registry fee. As a "Power User" Jo can buy Jinnee for
39DM. I do not call a difference of 9DM in price big$$.

As a MagiC user why should he be bothered by the fact that it is not
optimized for Geneva, N.AES, TOS and MultiTOS ? Jinnee is optimized to
give optimal results in MagiC, and that's exactly what it does.

Thing probably is the best desktop running under MINT/NAES. But it is
out of his league against Jinnee under MagiC. It will take more then one
update before both can be compared......

>Reschke and the cdplayer by Alexander Clauss

I'm glad you like it Bram, To extract a audio track You don't even
need CDPLAYER. Just Drag your CD ICON to the Mediachange.app and
you will see the tracks displayed as WAV files. You can copy them in
the normal way (much faster then extracting them and just as good)

>
>Oops now I need a Gigabyte HD for audio recording ;-)
Not really, If you don't use a CD WRITER at speeds higher then 2x. You
can easily copy the tracks from the CD ROM to the CD WRITER, this is
only possible with SPIN installed (running under MAGIC or MINT/NAES)

A ton You say ??, well just name me 10 Unix applications that have been ported to Mint, and which only run on MINT

>No, actually, I've seen the Java software while browsing through what
>was available for Mint.

Java is a programming language, So why is it that the arrival of JAVA to the Atariplatform is such a good kept secret? I imagine that would be THE news, certainly if it would only work under Mint
You probably ment that the software You saw running on Mint was a ported application which was developed under Java, but that's not really the same thing is it?

>One thing I have always said is: No matter what platform, what OS,
>what ANYTHING you use, if it offers everything you need, works well,
>and is enjoyable for you, then that's the best OS possible

Yes, You are absolutely right but the last couple of months everyone who is not running MINT/NAES and dares to mention this, is being told so. If one has a problem or need help/advice there's always a guru telling us that the same application runs better, smoother,faster, more flexible under MINT/NAES.
A freelance writer objectivity is questioned, a software developer being more or less flamed because he likes MagiC better, someone who like a certain desktopprogram which only runs on MagiC is being made ridiculous. If one mentions that a certain application runs on MagiC but doesn't mention the fact that it also runs equally well on THE OS, well, right, he's being told so....etc etc etc... it just goes on and on and on....

Jo wrote on 1 Feb 1999:

>No, he means Java, which currently needs MiNT

Jo I'm puzzled, help me out here. The last couple of days everyone
is telling me that Java exists on the Atari and runs under Mint....
Now, it must be me, being blind, dumb and ignorant but I don't recall
having heard or read that somewhere. Java coming to the Atari platform
should have been BIG news. And still, only a few (the choosen?) MINT
users know about it. What's the big Secret ? Who ported Java to Mint ?
He/she should be nominated for "programmer of the Year award". You are
talking about Java the programming tool, and not about a Java application
I hope?

Anyway, please give me a url or address where I can find it. I suppose
it's commercial because a task like this one seems unlikely for one man
to do. How many MB do you need to install? Is a harddisk of 270Mb enough ? can I still use
my TT or do I need to upgrade to a clone? Will my 36Mb
memory be enough or do I need the new 128Mb Axit card? Has someone already
developed applications with it? Can pigs fly ?

Cheers from Belgium

Henk wrote on Wed 03 Feb 1999;

>But ASH now sell's both a OS and apps; Lets hope they dont develop
>into a nanosoft corporation.

ASH has always sold apps and since 1993 MagiC also, so in a way you
could call them a "small Micro$oft". But can You imagine the Atari
market without ASH : No Kobold, Cab, Jinnee, Artworks, Papillon, Phoenix
NVDI, Texel, Signum, Scripter, ASH Emailer etc....

Like it or not but ASH is the biggest player in our small market, if they
close the Atari era then things would really look bad. Lets face it, what
is left ?? Not a lot ... Papyrus, Calamus and a few others

Cheers from Belgium

FOR SALE

-1040 STF (updated to 16 MHz)

-SM125 : mono monitor

-SC1224 : color monitor

-Screen switcher for above

-PowerScan handy scan with software (brand new)

-Overscan card for STF (no more black border around the screen and
more pixels on screen)

-2 fan regulation for any Mega series: Mega ST, Megafiles ...
really efficient for noise reduction !

-Tornado 28800 modem

-2 vga PTC1426 (TT color models)

-TTM195 19' mono screen for TT030 or Mega ST with special card

Everything in perfect condition ... very carefull last owner !

Make offer ... discussion always possible.

Be aware I'm living in Belgium ...

Contact me by email thank you

Katherine wrote on Wed 3 Feb 1999:

>Jo, I DO know you don't have no fun with your atari. hence my bet about
>you getting another machine quite soon.

Katherine about a month ago, Jo posted a message in this newsgroup which
to me says it all : message id <3691258023639@ping.be>. I suggest You
read it and keep the cheque ready. Because one thing is clear to me; what
ever happens Jo is going to be here for a long time to come, if you look
at the passion in which he describes his setup and future plans, I think
even some kind of apology towards him is in order.
All he did was to mention the fact that he likes Jinnee, so the fact that
someone likes a certain desktop is a good enough reason for You to try to
make that person ridiculous. I gues he's lucky You didn't put a spell on him.

>Now some peeps here, might destroy such a passion with some: "Hey Jinnee
> at least can do background pics", or the like: "Magic supports
> proportional fonts at least."

I wasn't aware that there are still AV servers around which don't support
background pics. Yes, Magic supports proportional fonts so what. I don't
really see the connection between this and destroying Your passion.

>I am curious to know what you "Jo" are gonna do next.
>New Desktop? new OS? (oh no, don't want to talk about MiNT/Naes, that's
>true) New machine perhaps?

I can tell You, he said he's going to get a new desktop, he will not
change OS because he's already got the best there is available for Atari.
And if he wants to buy a new machine, whatever it is, he'll be able to run
his favorite apps from it thanks to MagiC

>I can tell you one thing though.
>If Atari as of today was only ruled by ASH/Magic.
>Me, Katherine L. Ellis would quit Atari.

Lets see, You obviously don't like ASH for some reason, so I gues You
don't use any of their programs, right.

You don't use CAB as a browser.
You don't use NVDI, so all progs which need NVDI are out of the question
You don't use Kobold, so you copy, rename and move files manually
Well, what do you use instead? Lynx browser, Speedo GDOS, Fast file mover?
oh boy, that must be fun running under Mint.... not to mention fast of
course.

Talking about speed, STING is about 1000cps slower then Iconnect, and so is Your precious Mintnet. It might have been the first app which allowed one to go on the net, but now it is outdated, aren't you the one who's always telling people to move on? You don't believe me, well, a couple of days ago I told this story in a other posting, all the reactions agreed. No one guy saying it wasn't true, not even your precious gang. Hard to swallow I gues that MagiC and his applications beats the rest.

>What's sad here is a need for the users to lie, or misinform people to
>promote an OS.
Yes it is. Have You ever thought about this:
I gues that around 85% of the Atari users don't have acces to internet, because of various reasons. A lot of them probaby think it's impossible with a Atari. That leaves 15%, I gues more then 10% don't know what a newsgroup is or just isn't interested in it. So we've got 5% left (The Elite), yes us.
Lets talk about the 85%, which is not connected, what do they do with their Atari, what applications are they running, what OS? I don't know and neither can You. But one thing is for sure, if ASH would only sell a couple of hundred versions of MagiC they would pack it in (Cherish the thought). There must be thousands of people using MagiC, all content, and not complaining, and yet according to You they are DUMB, BLIND and INGNORANT. Sorry Katherine but I think it's the other way around

Cheers from Belgium

*** Update: Microsoft accused of altering video

WASHINGTON (AP) - In a dramatic courtroom confrontation, the
government accused Microsoft Corp. Tuesday of falsifying a video
demonstration aimed at showing severe performance problems after
government attempts to modify its popular Windows 98 software.
Justice Department lawyer David Boies stopped the video demonstration
in midframe to show a subtle inconsistency: a software title bar that
suddenly changes in the middle of the test. The video had been played
in court Monday. Boies charged - and James Allchin, a senior vice
president and top computer scientist at Microsoft acknowledged - the
change indicated the test actually was completed using a version of
Windows unaffected by the government's modifications. Microsoft's
lawyers looked crestfallen. See

>the other clones ...

Not at all. The only reason is that Magic is relying to much on the
hardware. That's why is unstable on some Falcons. This is also the reason
why the standard version doesn't work on the Hades and Milan. Why comes
the Milan only with N.AES and Thing? Even Geneva works on the Milan. Magic
DOESN'T

>I think this is an extremistic (right word in english ?) point of vue
>because a lot of people can find "some" happiness while using MagiCMac

Not extremistic at all. The only reason why I should buy a G3 is
for the speed when working with Calamus but if you print something
out with Calamus by means of powerprint you realy loose that
speed. You're even better of with an old Mega ST.
I sometime need to print out more then 100 pages from one single
Calumus doc. I guess you can count. 100 pages x 3 minutes/page.
So why the hell should I buy a Mac with MagicMac if I can work
much faster on my Hades? I do know a professional printer who
already regrets he has bought a G3/MagiCmac for the same reason.
Instead of gaining money, he's loosing money.
And where will this end you think? Right, he will buy QuarkXpress
and forget all about Atari.
Sure lots of people finds happiness with MagicMac but I bet they
don't use Calamus SL98 at all.

>
>"Money money money" is an old song ... but always has some success ...

That's why you want to buy that TT030 acceleration card of Centek? Will
MagiC run on that card?

>See you soon "en chair et en os" for the pleasure to recover a brand
>new boxed TT !

You surely have done a beautifull job (hope). It's a pity that N.AES/MiNT
can't be used for the moment on my TT030 (not fully installed) otherwise
you could have take a look how it's performs on the TT030.

>anything that suits you.

The problem with Jo is that he has an artistic mind. Beeing so he
always looks for something colorful hence he likes Jinnee. Jinnee
supports background pics and background pics in windows making it
looks like a painting. With Jinnee he really can create more or
the less an desktop to his desire. If it's a good desktop or not
he don't care as long as he doesn't have too much trouble.
I'm also a registrated user of Jinnee but after only one week
working with it I putted it back in the box. For me it was of no
use. Jinnee only works very happy with MagiC. It doesn't support
MiNT progs (prg's without an extension). It need that dreadfull
Wdialog to work etc....

>I bet you even that when you
>had once Neodesk/Geneva, you could have sworn it was the best environment
>ever, and that magic was not for you.

In fact he did that. He persist in using Geneva/Thing with MiNT/MiNtnet
athough he knew that it wasn't very stable at all. I had a hard time to
convince him to use Thing instead of Neodesk. Why? For the same reason I
give above. Neodesk does a better job when it becomes to background
pictures. He really had a very colorfull and artistic desktop but alas not
very functional with his Internet setup.
The troubles he had with Geneva/MiNT/Mintnet was the mean reason
I guess why he switched over to MagiC.

```
Double sided double density (DSDD) 3.5" disks. 720K

> B - where I can get said disks

Some shops still carry them. If you can't find any, just get some HD disks
and stick a piece of tape over the HD hole. This makes them less reliable,
but it often works.

> C - If and how I can run a system diagnostic

Get sysinfo.prg from the quick FAQ.
If it was never modified, it has 1 Mb of RAM and no hard disk.

Can you explain me how you managed to get a fast print with the powerprint
and Calamus SL? So far I didn't succeeded to make Calamus print at an
usable speed. Right now it takes some 3 minutes to print out in 600 dpi
one single text-only doc (150 kB) on a HP laser jet 5 (pc model).
Needless to say that's useless.

>Ehh, what Katherine said is that she'd been told about three people
>that has stopped subscribing, nothing else.

And 50 new people have subscribed. Not one person has told us that they are cancelling their subscription because they think we are MagiC biased. Those people that state a reason normally say it is because they are switching platforms. I didn't like the spin Katherine put on things. She doesn't read the magazine, she doesn't represent our average reader from the feedback we get, so I really think she is not in an ideal position to comment. Relaying things she has heard from others, which may be true or untrue, is unfair and damaging to us. If three people have really stopped subscribing to us because they think we have a MagiC bias, then that's sad to hear, but it's the first I've heard of it!

>This is correct, but it's also correct that whenever there is a
>OS-specific article it's usually about MagiC. And there's no question

Because no-one has ever offered to do a proper article on MiNT. I'd love to see a series of articles on getting MiNT up and running, but we've had no offers from anyone. But, look at the boxouts, we mention that apps will run on TOS, MiNT, MagiC etc if applicable. If an app only runs under MagiC it's hardly our fault is it? Same goes for some apps that are only MiNT happy! We reflect what's out there and what gets sent to us for review.

>where the screenshots are taken. So I have no problem understanding

OK, some home truths here, in AC#11 there were about 40 to 45 per cent of the screenshots taken under MagiC, the rest were under MiNT, TOS and MAC (NoSTalgia article). The main reason for the apparent MagiC bias is because a lot of the articles sent to us for publication (often from people NOT using MagiC) come without suitable screenshots, therefore the editorial team has to do them, as myself and Joe Connor are basically the only two people involved with doing the magazine production, and we both use MagiC, this is why this apparent bias occurs. Take this factor out of the equation and the real figure drops by at least 10 per cent.

>that people feels that AC is MagiC-oriented. Heck, I feel so myself,
>but I'm not canceling my subscription ;-)

Glad to hear it! :-)

There is no 'official' or 'unofficial' AC bias towards MagiC or any other O/S, but as a voluntary team we are reliant upon contributors, who use their own systems, whatever that may be.

I'm just looking at the contents list for AC#13 (AC#12 is at the printers right now), and there is nothing in that issue that is MagiC specific, almost everything is of general use on any Atari O/S.

But seriously, if anyone wants to do articles on any aspect of Atari computing, we are always willing to read and consider publishing them!

Hope that clarifies a few things without prolonging this thread overmuch! ;-)

Kind regards

Mike Kerslake

>Not surprising, since its editors are all MagicMac users...

The one and only editor uses MagiCMac. Most of the magazine layout (at least 75 per cent) is done by me on a Falcon using Papyrus, I don't have ANY other computer in the house or for work - GEDDIT! Most contributors use Ataris as there only or main machine. The subscribers database is maintained on a Falcon (not mine), the admin is mostly done on Ataris. When you know what you are talking about...

>Maybe they should rename it "Magic Computing".....?

Why?

AC provides coverage of the general Atari scene. Quite why you and Katherine object to this is beyond me. If AC doesn't suit you, then start your own specialist magazine. The simple fact that we have people subscribing through until next year, and our subscriber base has gone up by around 50 in the last month or so, plus we had an influx of NEW readers at the last UK Atari show is pretty clear evidence that what we produce is quite obviously what many people want!

I couldn't give a monkey's about what system our readers use, beit TOS, MagiC, MiNT, anything else, I really don't care. As long as people use their Ataris and get enjoyment from it that is all that matters. It's supposed to be fun, not a war. Why a tiny minority have to make it a crusade for one O/S or another I really don't know - to me it just sucks bigtime.

I eagerly look forward to the first issue of MiNT Computing, I'm sure it will be a big success!

Kind regards

Dodging artfully the flames and projectiles in the OS spat (which I am studiously keeping out of, having said my piece in a previous debate on the matter)

Martin-Eric Racine <q-funk@pp.fishpool.com> wrote in article <Pine.LNX.3.96.990204122757.15283B-100000@hal.fishpool.com>...

> Interrestingly enough, I just e-mailed Oliver Buchmann of ASH yesterday,
> to request English programming docs for Magic. His reply? "Sorry, there
> is none" ...
>
> How the hell do they expect people _outside_ Germany to actually support
> those MagiC nicies, if they never bother with the non-german world?

This is an oft-repeated complaint and a valid one in many ways. As a result of this, and a brief discussion here a few weeks back, I'm trying to get together a "community project" to translate the MagiC programming docs into English.

The general idea (Guy Harrison's) is to put the docs up on the web so that anyone with the necessary programming and language skills who feels the urge can translate bits as they please, so that over time a complete translation may emerge. I am not a programmer and have no German, but I can offer web space and co-ordinate the results.

I've already been in touch with Andreas Kromke and he's given us permission to go ahead and been supportive of the idea, so the plan is to try to get a pilot going reasonably soon.

Once there is something up and running, I'll announce it in the group. Anyone who wants to help is welcome, and if you want to mail me about it feel free. NB follow the instruction in my sig about my mail address!

>This looks like a mammoth task,

Well perhaps programs could be grouped. OS, Patches, Accelerators,
Serial port, Screensavers, File selectors etc. You might have several
of each, but but only choose one at a time from each group of course.
So a running order for these groups might be possible to establish..

>>And when trying/testing software out, sometimes they cause a clash
on a >specific program

>>A list of what doesn't like what would be ideal, maybe there is
one!, as opposed to a list of in which order;

That sounds very useful. For example I read that Newsie doesn't like
WDialog - as a result you can't run Cops with Newsie, and as I use the
same setup for Cab, not there either. All depends whether enough
users think it worth the trouble..

The author of sting said it here that there is no further debugging of his
api for the buggy (which is true, aes 4.1 is extremely buggy) aes 4.1 (aka
atari Multitos)
In a way I understand that and no prob with me. I just wanted to let you
know that if it doesn't work with multitos, don't be surprised thinking
that sting is bad. Just that sting&multitos don't go together very well.

Either:
get your money back from magic6

convince magic author to fix your problem. so you still can use magic6,
magic ain't that bad, it is the most popular os in this newsgroup after
all, can't be that bad.

convince Perot (sting author) to make a fix for multitos (which probably
won't happen, and I understand him)

Buy naes to run instead of multitos in MiNT (sting works well under that
AES)

Have a go for iconnect. (some people here say it is really good,
sometimes, gotta trust these fellas)

Or, if you have at least an IQ of 500, you can try to set up MiNTnet.
And use gluestik for stik application.

btw people, I had an idea which:
would let you use your sting dialer to edit your script and parameters.

Then run my prog which only converts the data from sting an puts them into mintnet type.

Should be fairly easy to do. And at least if you know that sting works well, well, just convert it into mintnet setup and reboot. Should be all there ready for you to connect.

How hard could that be to use?
bye

I have:
Magic, MagicPC, N.AES, Geneva, Mint, Tosbox, STemulator, Gemulator,
Pacifist, Winston,
and a TT030 with plain old TOS and maybe a few more I can't remember. I
sometimes use
any of the above OS's but mostly just use Tos. Each have their merits
and their supporters.
I think the fact that there are now so many ways to run ST, TT, Falcon,
Hades, Milan programs
is one of the strengths of this platform and one of the main reasons new
users show up from time to time. We should just enjoy the variety and
get on with it, the only thing I see coming
from all this discussion about OS's is the daily message count on this
newsgroup has gone
from about 40-50 a day to 80-100 daily and the number of messages I
don't read has
gone from 0 to 40-70 a day. But that's just my opinion, I could be
wrong.

Jim Donovan

Happy to run everything !

2243. Laser printer questions

Newsgroup: comp.sys.atari.st
Date: 1999-02-04 00:00:00 UTC
From: "Thomas J. Andrews" <tandrews16@delphi.com>
Message-ID: <BLTVrRR.tandrews16@delphi.com>
Source record: 84908

I tried posting this in the Tech newsgroup, but didn't get any answers. Now I'm gonna try it here...

A fellow former user group member gave me all his Atari stuff a couple of months ago, as he expects to move soon and hasn't used his Mega ST4 in 2 1/2 years. (Using the Spectre GCR seduced him over to the Mac when new ST software slowed to a trickle) I've been an 8-bit user since 1985, and am rather new to the ST, but I'm learning. I expect to have a few questions from time to time, and tonight is the first one.

The inventory included two Atari SLM804 laser printers. They were supposed to each have drums and toner carts that were about half used up, but when I tried them out the results were so faint as to be barely readable. From my reading I've decided the drums need replacement, since the specs say there is a 2.5 year storage life on the drum. Also included in the inventory was a sealed-in-the-box drum kit, so I'll probably try that first. My questions:

The drum kit is a minimum of three years old, probably more like five. Is it going to be any good any more?

Is there a shelf life for the toner? I don't have any sealed toner carts. What I have has been kept dry, as far as I know.

Is there a (reasonably) cheap supplier for drums and/or toner carts? And, what is the cost these days?

I saw a DeskJet 400 in Walmart the other day for $98. If what I have doesn't work, would I be better off to buy one of them? Are there drivers available that will work with that DeskJet? (SpeedoGDOS, Word Perfect 4.1, Pagestream 2.1, G+Plus, etc.)

That should keep you busy for a while. If I think of something else, I'll get back to you.

TJ

your best bet for that would be to get ahold of NVDI 5; this has
all the up-to-date drivers you'll need, including a large number of HP
printers (there's even a dedicated HP 540 driver in there).

I'd suggest calling HP to see what driver will work as a sub; I
know that for a large number of HP printers the 500c and 550 drivers
will work.

2245. FREE Atari Catalogs by E-Mail, FTP & the Web! Free Atari stuff!

Newsgroup: comp.sys.atari.st
Date: 1999-02-04 00:00:00 UTC
From: bensmith@user1.teleport.com
Message-ID: <79duiadme1@user1.teleport.com>
Source record: 84910
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,or.forsale,pdx.forsale,pnw.forsale,rec.games.video.atari,

Please direct all replies through E-Mail to bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I do not regularly read NewsGroups.

I have some stuff to unload. I have a lot of Atari Magazines. For the person who takes the whole lot. Some including disks. I don't want to have to go through them or sort them out. I just want someone to take them off my hands for the cost of Shipping. Classic Atari 8 Bit & Atari ST. I also have some Atari Hardware that doesn't work that someone can have for spare parts or tinker with to try to repair.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my Desk-Top Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can load them into your text editor or Word Processor and view them, edit them or print them out! It would make things easier if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend. Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

I suppose you mean CAB 2.7, not 1.7.

This is wrong. CAB 2.7 can run without MagiC as long as you replace IConnect with PPP and you get the right CAB.OVL file.

First of all, drop COPS. It appears to be quite unstable, at least on my setups.

You also don't need MiNT to run STinG. STinG was designed for singleTOS, but runs under MiNT if you put it before MiNT in the AUTO folder. Don't forget to setup HSModem too.

There are some quick instructions on setting up STinG in the Quick FAQ. It's pretty easy if you follow the instructions and you don't mess around the config files too much.

I've got v3.02 at present and I think that's the newest release but I'll check with a buddy and let you know.

Didja know a 35 year old Avanti captured the world speed record again for D Production? Hit 214 mph on Bonneville Salt Flats in 1997 using a 299 cu. in. Studebaker motor with a Paxton blower. And the beat goes on.... I haven't tried that with my Avanti but at 100 mph and 3,800 rpm she still wants to go for redline. Dare I give the baby her head? Did you see the Pure Stock Muscle Car Drags in Michigan? Little R3 Lark Challenger with a Paxton blown 304.5 cid blew the doors off 440 6-packs, 454's, 396 Chevelles, 442 Cutlass, etc. etc. Couldn't keep the tires glued down even at that, belts were slipping on the Paxton at 6,000 rpm and in the first 6 races he coasted (!) the last 320' of the 1/4 mile.... There will be a full article on same in the May 99 issue of 'Muscle Car Review'.

Hey I remember the Toronado... Frank Baker had one of the first in his restaurant in West Vancouver, right beside the 007 Aston Martin (before he sold it). How many do you have?

Good luck with Power Print! Hasn't failed me yet...

I am a retired systems programmer. That's why I mentioned the
interfaces. In the end I will choose the OS that keeps those interfaces
open, without fiddling with them every release of their OS.

In that respect I think that the modularity of MiNT, loadable
files and device systems, GUI and desktop has more appeal.
Open interfaces on many levels. With MiNT as basis you use whatever
you like the best. (Or of course the beautifull & perfect kernel that haunts
my mind, but hasnt yet materialized. ;-)

But this is all hope.
If one corporation swallows all the othors, I wont have anything to choose from.

This however will not stop me from doing what I love to do.
Programming what I think is fun to program.

Henk.

2257. What Happened to the Stos Mailing List

I sent a message to it but there is no reply..Has it changed it's email?

I posted a message to it about a problem with the STE extension in Stos. When I load Stos from my Hard Drive (tower with CD Rom), It bombs out as soon as it trys to load the STE extension. I know the extension is not corrupt because it loads ok from floppy disk. Anyone know what the problem is? I use Extendos to mount the CD drive and I have partitions C to G.

2258. Auto Programs

Newsgroup: comp.sys.atari.st
Date: 1999-02-04 00:00:00 UTC
From: cjohns@yplace.demon.co.uk
Message-ID: <918087822_OASIS_@yplace.demon.co.uk>
Source record: 84974
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Has anyone attempted to make a list (or lists) of autoprograms in an
running order which doesn't cause conflicts etc. Its hard to remember - or even
find - the readme docs which say run this before that but after the other.
For example - Falcon single tos - XBoot

XBoot/Superboot/Stoop
FPatch2 (Not needed with NVDI3+?)
NVDI3
SpeedoGdos
Selectric
Drvin
MFP, SCC etc
Sting, STiK
WDialog
Videlity
FolderXX
Sam
Stikstr
Mintnp/ Geneva/Magic etc

Add more to the list..

It would be instructive to hear from Those Who Know what the correct
order would be. Trial and error is all very well, but knowledgable
help would of more assistance to most of us I imagine. Throw in your
autos to this list and lets see if anyone is bold (and informed)
enough to put it all in order...

Here's hoping

CJ

P.S.

The MILAN Gmbh now possesses the rights of the original Atari TOS's.
They,ve put together the falcon tos and the tos3.06, fixed a lot of known bugs,
addded some usefull things, and put that into 512Kb flasheproms.

Continuation of the interfaces by a third party.

That's why I always loved Atari, it gives you the illusion that with a
couple of friends and enough time you could do it all yourself.

Henk.

Message-ID: <79b1jg$342$1@cubacola.tninet.se>
Source record: 84978

Well, maybe I'll be flamed for this post, but then so be it.

I believe most people on this group has come to the conclusion that
the discussion about which OS is beating the shit out of the other
one is quite meaningless.

Somebody says, let's end this cause it won't lead to anything good.
And in the next second same person picks up a pie and continues...

It feels like if not the MiNT:ers nor the MagiCians wants to end this
without having the last word. Sure both these OS' have there
advantages, I believe there is no doubt about it. It is just a matter
of what the machine running either of them is supposed to do. Since
it is higly unlikely that none if these system will be abandoned in
the near future, I guess that cooperation is the only way to ensure
that the atari-community will exist for yet some time.

I therefore finds MiNT-only and MagiC-only just as bad, when thinking
of the (possible) future of the atari-platform. At least commercial
software should not be OS-dependent in this way. IMO. Surely the
atari-market is a bit to small to be split in halves?

We are all on ataris, or compatibles at least.
What OS we run is mainly a matter of taste, right?
It would be nice with more compatibility between both OS' and people
on this newsgroup. There are times when the superiour attitudes rule,
and IMO that is unnecessary.

I know these things probably has been written time and time again,
but I felt the need to write this anyway.
Now, if somebody wants to feel offended by this, feel free to do so,
but that was definetly not my intention. I deeply regret this posting
took place if it just results in more fire...

Regards,

Joakim

Subject: Re: MINT Superior ?? was IConf question
X-Newsreader: NEWSie Version 0.94 (Atari)

Well I have to say I was a non-believer until I installed MiNT
properly. I purchased Atari's MultiTOS stuff as did alot of others
and was let down somewhat, honestly I never really used it for much
more than testing. However after installing one of the newer MiNT
kernals with Thing Desktop and a few other nice extras like TaskBar I
am actually amazed how well it all works. I feel sorry for the people
who wish to rely on old info based on multitos, it simply is not like
that if you purchase N.Aes. Why does MiNT seem to mean unix? Because
these people don't bother to investigate before opening their mouth.

I admit the installation tools are not so great, but that can change
like anything else. Personally I'm glad I spent hours installing
MiNTnet rather then spending $$ on magic. I didn'y quoted DarkChyld
because it is pretty much the same here and he said it very well.

I also think I-Connect was a total wasted effort, but then I guess
they had to do that due to lack of standards already set forth on
their part.

That sums it all.
You don't even know what's going on in MiNT dev.
Bashing about something you don't know is rather easy.

I just open my /usr/bin folder what do I see? 235 objects.
Open my /usr/etc 72 objects.
Open my /usr/ucb 35 objects.
open my /usr/local/bin 26 objects.

Latest one in date, micq 0.3.4 (latest btw)
And mpg123.
Of course, I take it, you guys don't want to play mp3 files. Nor have icq
pager. right?

hm nope.
kaffe, as in www.kaffe.org

You probably didn't see it because everytime you go on an ftp server
atari, and you see a MiNT folder, you are like blah, avoiding it.
Could it be?
Or could it be that you are not on the MiNT email list? hence not having a
clue about what's going on in MiNT?
Or could it be that you don't check MiNT pages on the web?

I was talking about window background pictures.
which only jinnee (and thing 1.29 now) support.

Now, the relation, don't see it? ok lemme explain then:
The relation is that some people are working hard for free into things
that are more important than just the look of a font in the OS.
Things more important like, memory fragmentation, protection protection,
prioritization, communication protocols, efficiency of the kernal
scheduler, optimization and compatibility with wider hardware addons etc
etc.
Then you have some people, because they can't have proportional font size
14 will just not like one OS.
ok, fine, that's their choice. no prob with that other than it DOES put
down the serious efforts some people are making into a free project.
Which reveals after all to be more efficient. (you don't have to trust me
on that one).
Now, that's destroying a passion, because if you do it for free, you do it
for others to enjoy.

Same remark could apply to you.
To you jpegem is worthless coz imagecopy does it all.
1) it proves me that you have found a NEW way to use image copy that I
didn't find, coz dithering with X parameters scaling down, grayscale etc
saving as whatever format. Tell me your secret.
2) it puts down the jpeg group which have VERY fast and efficient
routines.
3) that you didn't get what jpegem was all about. It is NOT a viewer per
se. (eventhough you can forward the output to the av-server, I won't
explain how I use it here, but hmm quite efficient, and I do have
imagecopy as well, which I use as av-client for jpegem, so they are
complementary, not, one or the other.)

> I can tell You, he said he's going to get a new desktop, he will not

Ok, change that last line into something less subliminal.

> And if he wants to buy a new machine, whatever it is, he'll be able to run
> his favorite apps from it thanks to MagiC
which btw is what? papyrus? papillon? nvdi? texel? cab maybe?
come on, I can imagine Jo with a macintosh (or pc) on the web with CAB.
When he can get the free IE or Netscape, (on which I won't even comment
about functionality, speed, more modules, javascripts etc)
Same goes for texel, you think he will buy texel, rather than Excel?
Or maybe papillon rather than photoshop (to name just one).

I don't want to blame magic, magicmac, magicpc.
However it is foolish to think that magicmac/pc is an atari.

> Lets see, You obviously don't like ASH for some reason, so I gues You
> don't use any of their programs, right.
In a way, I couldn't care less for ASH.
Because, if it ain't ASH that distributes those products, someone else
would have.
Alexander Clauss has started CAB before ASH distributed it.
ASH doesn't make Magic, nor nvdi.
Behne bros, and Andreas are the one I care for.
etc

> Talking about speed, STING is about 1000cps slower then Iconnect, and so

> No one guy saying it wasn't true, not even your precious gang. Hard to
> swallow I gues that MagiC and his applications beats the rest.

Ok, this one is totally out of control.
1) old doesn't mean bad, or outdated.
2) look around you, (cross platform)
3) pppd is a standard tool still getting updated, an probably pppd latest
version is even MORE recent than your sting or iconnect.
4) it somewhat proves that 1 tools 5 years ago, still used today (updated)
is not bad at all. And as far as I know, you are spitting on half the ISP
worldwide and the million unix users (mac, pc, powerpc, MIPS etc), They
all use this "OLD outdated tool" to connect on the net.
I guess Peter R. (no offense Perot) should enlight the world about his new
revolutionary internet stack. Same goes for iconnect author(s).

> INGNORANT. Sorry Katherine but I think it's the other way around

Ok, fair enough.

#1 rule, to sell more OS, no need to lie to people. (thing that they have been doing for years).

#2 rule, To increase the number of magic user efficiently. Get a bigger user base, (MORE hardware configuration, hades, milan, falcon etc)

#3 rule, in addition to that, make ENGLISH version of DOC and OS, giving full support for other country, Hence more revenue.

#4 rule, keep a backward compatibility, not denying some simple calls already implemented years ago.

#5 rule, advertize intelligently in effort to get NEW people, coming from other world, pc and mac, with magicpc/mac. What they are only doing now is the opposite. Getting atari people to buy a mac or a pc to still run magic.

#6 rule, Just make a good stable fast OS.

Has ASH, or Andrea been working on those?
If ASH is gone by not big enough userbase, don't ask me why.
As a business, nothing is ever enough. They seem to not care about many points, which is not very clever imo, because they are loosing money in a long term and short term also.

btw: I do not wish ASH to go away. Certainly not.
Same applies to Andrea, and company.

As far as blind, ignorant, stupid. Well.
This is all relative. If you take it litteraly, of course, that's not so good.
Also doesn't apply to everyone.
In example, Uwe seimet only uses magic, which I respect. Coz he has his reasons, which are totally valid.
Same goes for other people.
However, some others which I won't name, don't know what the hell they are doing. which is fine in a way, but up to some extents.
In example, spreading some stupidity, or lies, or non-sense around here.
That is certainly not helping anyone.

For those that are getting annoyed by me, I am sorry. I just care about atari, and feel I have to express myself. Sometimes too roughly.
True, I could shut up, and let go. (but CAN'T)
Sorry once again.

Jo wrote on 04 Feb 1999;

>Developers and publishers are not the same thing. Without ASH,
>somebody else could publish MagiC, Jinnee, CAB, Artworks, Papillon,
>Phoenix, NVDI, Texel, Signum, Scripter etc.

That is absolutely true, but it wouldn't change the situation. What
makes You think that if an other publisher would publish those programs
they would drastically change? Don't tell me You are just as paranoid
as Katherine and believe in the "big ASH complot against Mint" users
also?

All of the above mentioned programs have in a certain way influenced the
Atari market, with the exception of Jinnee and Scripter they can all run
in TOS. Are there any substitutes for Phoenix, Artworks, Signum and in a
way Texel ? Not really, So let us be glad that ASH is still supporting
the Atarimarket, giving the developers the chance to continue developing
their apps. That last sentence is really important, suppose ASH would
announce that they pull out of the Atarimarket, that would leave us with
ROM (Papyrus) and Invers (Calamus), all the others are struggling. If You
don't like the marketing of ASH, Youll sure hate the Invers Marketing, and
ROM doesn't even manage to give a good service to their clients with only
one program in their folio....

>Are any of these developed in-house? And except ASH Emailer, does any
>of these *require* MagiC as ASH marketing says?

No they do not, but what ASH is saying is if You want to get the best
performance out of these apps, they should be run on a Multitasking OS. I
find it only normal that they recommend Magic, it would be quit strange if
they recommended something else....Philips recommends Philips CDR for their
CD Writers. JVC recommends JVC VHS Tapes for their videorecorders.....

Something else to consider is the fact, that most of the Atari users don't
have/share the same knowledge/passion as we in this newsgroup do. The big
majority of the users aren't even on internet. The few magazines which are
left don't really give much info about OS. And if occasionally they do, yes,
it will be about MagiC, why ? well at the moment it can be installed very
easy, even the biggest dummy can install it. If one wants to install Mint or
one of the derivates it takes a lot more then typing in a registration code.
So as long as the installation is user unfriendly, and there is no proper
channel of distribution, I'm afraid Mint and co. will always play in second
leage compared to MagiC.
Does this make MagiC the better OS?, no certainly not, but it is the most
widely used and since it runs on Mac and PC some developers actually develop
their apps on a Mac running MagicMac. That's what I meant when I said to

Katherine and the others: "welcome to the real world".

The most important thing however is that the OS stay compatible. Who should set the standard? Well that's what the MAGIC vs Mint discussion is all about. MagiC is marketleader and if it should become the standard, it's easy for the various developers; One publisher sets the guidelines. If Mint becomes the standard I'm afraid there's going to be chaos. Just have a look into a typical ftp archive; open up the Mint directory and it's clear to see for all: chaos. Different derivates, different rules, different docs and even different installation apps and procedures......

Atari users have come a long way, the last ten years have been tough, we all are a special breed with the same passion, we should keep it that way for at least the next ten years to come.......
Lets agree we disagree, but we do have/share the same passion and that is what is important here.
We even see pigs fly on a fridaynight -))

2270. MINT Superior ???

Newsgroup: comp.sys.atari.st
Date: 1999-02-04 00:00:00 UTC
From: dennis.vermeire@ping.be
Message-ID: <79bdhm$b1n$6@news3.Belgium.EU.net>
Source record: 84986

I received following email from Mario, somehow his postings don't get on
the usenet anymore. So here it is......

<SNIP>
In article <794tnh$93m$4@news3.Belgium.EU.net> you wrote:
: Martin commented on Sat 30 Jan 99;

: >>What applications are impossible for MagiC but are easy to do
: >>with MINT/NAES ??? <<

: >To name a few micq and java. Java ofcourse only on quick machines. There
: >are sure other prog's.

: I think You mean JavaScript, this has nothing to do with MINT but with the
: browser understanding it. AFAIK CAB, Wensuite and Draconis don't support
: JavaScript for the moment. Java is a programming language wich is not
: available (yet ??) for the Atariplatform.

Actually I think you are getting mixed up there ;-) I don't know of any
WWW browser for MiNT that supports Javascript, but Java certainly is
available (and has nothing to do with a WWW browser necessarily).

: I don't really know what micq is (I'm not a MINT adept) but I gues it's some
: kind of IRC client, if this is so. Well no problem here either, this is a
: job for STING and it runs just as well under MagiC.

micq has nothing to do with IRC. There are several IRC clients available
(including ones running under Java from what I recall ;-) But many PC
users use ICQ to talk directly to another user via the internet. Micq
enables this to be used on the Atari (or any UNIX machine).

: BTW: when I asked for applications I ment real life applications, like DTP,
: Database and Spreadsheet applications, Graphics processing etc...
: Don't tell me that You and all the other "misleaded" went through all that
: trouble just to run a couple of PD/shareware utilities ????

So Java isn't a real life application? ;-)) Or Lynx? Pine? Tin?
Mgetty/vgetty? I have not seen any mail or news reader for the Atari that
is as good as Pine or Tin, or any fax/voice program that comes close to
mgetty+sendfax/vgetty. Just because software is free doesn't mean it's not
any good ;-)

: While on the subject I haven't seen any of the other "STARS" ported over
: either: GLIMP, IMAGE MAGICK, STAR OFFICE, APPLIXWARE, LyX, NoSQL, CD GEAR,
: WORD PERFECT 8.0, LaTEX Frontend.... etc just to name a few.

The problem is that all these run under X, which has not been ported to
MiNT. Well there is a version available but it only runs in monochrome.

The real problem is that if you run X then you can't run your GEM apps, and if you don't have access to GEM then you might as well just use Linux or NetBSD (and although I don't use those on my Atari, I can't see why Programs like the GIMP wouldn't run on it). The only advantage of MiNT over those is that you maintain compatibility with your Atari apps. If someone would make a version of X for MiNT that runs under GEM, then things would be very good. But nobody's done anything like that, and it would be quite a big job.

Also I believe some of those apps you mentioned do not have source code available. You cannot expect an Intel binary of Word Perfect to run on a 68K Atari - no matter what operating system you use.

Sorry I replied to you personally, but my usenet posts don't seem to be reaching the rest of the world (I did post to the usenet as well, so perhaps I'll be lucky this time).

And please take everything I've said with a grain of salt; I've seen enough arguments about different OS's, and when it comes down to it, my opinion is that it's better just to use which one has the features you need.

Yes, I apologize for being too rude here with some people.

I apologize for using too much bandwith with those long boring messages, worthless "little wars".

I apologize for the fact that I can't stop myself writing back to some "not so important" attack on which I could pass on.

Sorry for your download time, probably cost lotsa money in some country.

I apologize to magic users which I don't have anything against.
Just that some of them are hmmm weird I should say, with a common sense that blows me away sometimes.

I apologize I have tendency to get into trouble very easily with some valuable people.
To name a few: Anthony Jacques, Tony greenwood, Nick Flinny, Jamest, Jo (U.T.S.I guy), Fred shwinden (I think that's his name), and now Dennis Vermeire.. (I probably forgot some others).` oh yes, Joe Connor, and Craig Graham. Maybe others..

So, I must look like the devil, or the bitch to some, I am sorry once again to all those people.

(btw I just have been told that Atari Computing lost 3 subscribers lately, (because of the Magic here, magic there, etc), don't ask me, I am not subscribed, so I don't know how bad it is in this magazine.

Each of us has a little devil part inside him, from time to time we have
to master it ...
It happens to anyone sometimes, somewhere, each day a few seconds,
each year a few days ...
That's human behaviour nature ...
We have a lot of work to change that ... and I believe it is possible,
if only we would like to spend more time and energy to achieve that
goal.

Katherine, you don't look like the devil and never will because the
wisdom is inside you you've just proved it !

You are a high mountain and you are'nt made of stone.

To give my Atari 1040STf the right time and date I'm using a
Forget-Me-Clock II clock cartridge, inserted in the ROM-port.
The time setting software that came with it (FMCII.PRG) only allows
the year 99 to be set to 00. This doesn't give the year 2000: Testing
my system I found the year to be 2028.
It is possible for me to set the correct systemdate using the control
panel, or CPX. But this new date is not "written" to the external
cartridge. I would like the correct date to be set automatically. Does
anyone know a solution for this problem?

>
>Any comment?
>

What probably caused the reset was the voltage regulators in the power supply, thay are thermally protected and will shut down (turn off) if they get to warm and then power up again once they have cooled down.
I have heard stories from service engineers about cats sleeping on warm equipment (usually VCR's), this causes several problems....
1) Damage caused by overheating
2) The equipment get gummed up with cat hair
3) The cat is so warm and happy that it looses control and urinates itself and thus into the equipment via the ventalation slots causing a lot of damage due to it's acidity.

Take it apart and make sure their are no cat hairs inside and look for damaged caused by item 3, I doubt that you wil find any as it probably would not work at all if that had happened.
If you mean be freeze that it stops working altogether (probelm not solved by reseting) for a while then I would suggest changing the regulators in the power supply as they may be stressed due to repeated overheating through out the day.

Hi Ken,

You could try Warp 9. It speeds up the screen redraws and has a mousie speeder (plus screen saver things if you're into that). It's commercial, but I think no longer produced, so may be hard to find. Easy on the budget, and takes up very little RAM. NVDI may be a bit faster, depending on the version, from what I've read. It has screen fonts which can come in handy depending on your needs/ wants. It takes up more RAM, and is more expensive. Warp 9 will run with Logic 2.0, 2.01, 2.5, and Logic Audio 2.01. I'm pretty sure NVDI will too, but I don't have it so, I can't say for sure. There are mousie speeders available to download. I've heard Silkmouse is nice.

Hope that helps,

Hi

This looks like a mammoth task, the combination of programs is
unlimited. I have a boot-up sequence that has several permutations
depending on what I am going to do.

And when trying/testing software out, sometimes they cause a clash on a
specific program and sometimes they don't. I have a Kobold boot sector
on the disk in the floppy, this sometimes cause the computer to bomb out
every now and then; I've no idea why and thankfully it doesn't do it

often, but when it does it can be a pain in the backside to get up and running, I tend to switch off for a few minutes.

A list of what doesn't like what would be ideal, maybe there is one!, as opposed to a list of in which order; if I've got hold of the wrong end of the stick then forgive me my painkillers are working yet:((

>Selectric 1.01, STinG 1.12)?

Do you mean 'why is it different?' or 'why is so big/small?', Charles?

Assuming the former:

All of these things (apart, perhaps, from Selectric and Harlekin) do
dynamic store allocation when loading. Some of this is
user-determined, much of it not. I guess that their store grab
algorithms are interfering with each other in a multi-tasking
environment. If you set multitasking OFF in Magic you would probably
get a more predictable result.

Just a guess :-)

OK - looks good. This is about as much as it will do without software
on the floppy.

>I dont know if it has a hard drive,

It won't, the Fs did not have internal HDs.

>I dont know what kinds of disks it uses,

Do you mean HD or FDD? The FDD will be a 720Kb (double-sided 80
tracks). It will read floppies written on a PC provided that they are
formatted to this standard on the PC.

HDs are driven by the DMA (Hard Disk 19-pin) port via a host adapter.
This provides a SCSI interface so up to 7 devices may be connected
(HD, CDR, streamer tape etc.)

>I dont know how much memory it
>has, blah blah blah.

Unless it has been modified internally it will have 1Mb RAM. There are
expansion boards which will take it up to the addressing-maximum of
4Mb.

> A - what kind of disks it uses

As above. Floppies from your nearest store but make sure they are DD
not HD.

> B - where I can get said disks

If you mean HD then you need a host adapter as well as a device. The
latest h/a is the Link2 and you can use any SCSI-1/SCSI-2 device with
it. Your best bet may be to watch this newsgroup fo second-hand kit.

> C - If and how I can run a system diagnostic

You need to get SYSINFO v4.5.

> D - Where I can get applications, etc

Start looking in ftp sites such as ftp.funet.fi - you will find most
of what you want here (including SYSINFO). Go to Hallvart's site or
UTSI for quick re-direction to some of the best s/w. You will find
both advertised in this n/g.

> E - Where I can get a compiler (BASIC or C preferable, PASCAL if
>necessary)

Not sure what's available here but Megamax C has been released PD.

>Id really like to sstart using it again. Ive decided to take on the
>ambitions goal of writing a program to make it communicate over some
>port or other with a PC running Linux.

You may find this has been done already :-) look at STiNG.

Sounds like you should be looking for:

HD plus h/a
Store expansion
Mono monitor (best for serious stuff)
Install Magic or MiNT for multitasking.

Good luck!

2289. AV_PROTOCOLL (g.wind.cycle)

Newsgroup: comp.sys.atari.st
Date: 1999-02-04 00:00:00 UTC
From: gokmase@hem1.CTRL+X.passagen.se
Message-ID: <79c58v$d54$1@cubacola.tninet.se>
Source record: 85005

I am currently trying to make a program of mine to support global window cycling through AV_SENDKEY as documented in THING.HYP. When my program is on top, it will top other windows below, but eg Thing won't top my windows again.

I guess I missed a point here, just wonder what it might be this time.. ;) Do I have to send the AV_SERVER some message for it to recognize my prog as a client?

Thanks in advance,

Joakim

>(btw I just have been told that Atari Computing lost 3 subscribers lately,
>(because of the Magic here, magic there, etc), don't ask me, I am not
>subscribed, so I don't know how bad it is in this magazine.

You really don't know what you are saying here! Atari Computing has
actually GAINED about 50 new subscribers in the last month or so!!!

Sure, people don't renew sometimes, the usual reason is that they have
moved to another platform. I have NEVER seen a letter or email from any
subscriber cancelling their subscription because they're upset with MagiC
mentions!!!

I find this totally beyond belief!!! The last issue of AC (#11) had no
coverage at all of any MagiC only material, apart from one single page out
of 60 which looked at certain widgets, most of which run under MagiC (maybe
another O/S as well). That's it!!!

As you said yourself you don't read the magazine - enough said I think.

Next time, read the magazine/talk to us before saying such comments please.

Talk about misinformation :-(

Kind regards

Mike Kerslake

> recognize my prog as a client?

Yes, of course. How do you think Thing should know about your window,
if not told by your program? (*)

Thus, you have to register via AV_PROTOKOLL, tell the server about new
windows with AV_ACCWINDOPEN, use AV_ACCWINDCLOSE when a window is
closed, and send AV_EXIT on termination.

Ciao

Thomas

P.S.: Followup-To: set

(*) Yes, I know this is also possible using WF_OWNER, but not all AESes
support this mode for wind_get()

Trystan

2293. Converting Pro24 files to Cubase

Newsgroup: comp.sys.atari.st
Date: 1999-02-04 00:00:00 UTC
From: Adrian Bradshaw <adrian@usanda.co.uk>
Message-ID: <79c9ht$7ej$1@newnews.global.net.uk>
Source record: 85009

I am a former ST user. I used my ST for MIDI stuff and have a number of Steinberg Pro24 files on disk which I would like to use on my PC (boo hiss). Transfering the files to PC is no problem, but I can't find a program which will read the .SNG files from PRO24.

Does anyone know of a way of converting these files to standard .MID files?

Any help would be appreciated.

...I have an ST emulator (for old-times sake) on my PC if that is likely to help me.

I just had to reply this!

> You don't even know what's going on in MiNT dev.
> Bashing about something you don't know is rather easy.

I'm sorry that some people are trying to make a living while also trying to live a normal live with "non-computer" friends. I wish everybody could take the time to drag themselves through miles of newsgroups, thousands of ftp-servers with thousands of directories, search the whole web and read thousand of german documents to find out whats happening in our computer-community. I wish ASH would stop trying to make a living in the Atari market. I wish I'd never paid for Texel, Art Worx, NVDI, MagiC, Jinnee and Kobold. I wish they didn't work that damn well, so I could have a reason to change to MiNT. I wish I didn't managed to setup IConf so easily so that I could choose Mintnet instead. I wish I needed to play MP3's instead of using my CD-player. I wish I needed ICQ! I wish I needed IRC! I wish I needed another spreadsheet, database or telnet client. But I don't! I wish I took the time to set up a new MiNTnet, but I don't. MagiC is also here to stay, so let's move on!

Geir...

>Vermeire.. (I probably forgot some others).` oh yes, Joe Connor, and Craig
>Graham. Maybe others..

Katherine, never ever ever apoligize because You have dreams, passions, strong feelings and opinions about a certain topic. Everyone here has the the right to express his/hers ideas. Because we don't see eye to eye on certain topics it doesn't mean we're enemies. I always liked a good discussion and when two people with strong believes get into a discussion it is quit normal that there will be some fire and a lot of sparkles. In a way it is positive to this newsgroup. Suppose we all keep our opinions to ourself, well, what's going to be left , questions like :"help, my diskdrive doesn't spin", "How do I partition a harddisk", "how do I connect a joystick to my ST" No, then I like to exchange opinions.....-)

I can not speak for the others, but we have certainly not fallen out, I would say on the contrary; this last week, first thing I did when I came home, was to start the Atari, download the newsgroups and see if there were any posting from kellis@leading.net... I would feel very sorry and sad if I would ever fall out with someone just because of a difference of opininon.

I think in the heat of the debate, sometimes things are being written which one doesn't mean. English is not my native language, and although I know it quit well, in the translation to English, feelings, opinions and even some technical expressions turn out different then it was original ment. Looking back at our "correspondence" this week, I thought I couple of times "did I really wrote that".

I've had a look at http://www.jammed.com to the postings in this group over the last two years. Yes, you sometimes came on strong, but when people start a discussion with You, they know You're going to defend Your opinions strongly so they shouldn't come crying afterwards, the people who go in the clinch with You are not newcomers in this group so they should know what to expect, right? -)
I'm following this newsgroup since september, at first I just read the topics, sometimes I was amazed, sometimes amused but never shocked. Then when someone had a problem which didn't got solved, If I thought I could help I send them a mail, sometimes I helped someone out, sometimes I couldn't solve the problem either. And now I find myself in the middle of a "War", the nice thing is that I did learn a couple of things this week , from You and others joining the discussion. So, that's positive is it not?

I'm sure that in the months to come, we'll meet again and "have a difference" in opinion. But that's good although some might disagree, its good because these opinions come straight from the heart, their about our passion which is called ATARI, and that's what we've ALL got in common here, be it hardware or even just the software.

Looking forward to our next "crossing"

Cheers from Belgium

I didn't mean Tempus 2 the text editor, which has set the standards also back in 1988. It is still one of the better ones but QED which is freeware comes very close.

What I'm talking about Is Tempus WORD Pro, this program has never been imported by Hisoft which is a shame and a loss for Hisoft as well for the whole Atari community.

<dennis.vermeire@ping.be> wrote:

> Talking about speed, STING is about 1000cps slower then Iconnect, and so
> is Your precious Mintnet. It might have been the first app which allowed

On my TT I have installed just about any TOS-compatible OS available today, just to see how they work and to get some inspiration for my MiNT/N.AES setup on my Falcon. I have MagiC6 with IConnect and STiNG, Geneva 006 (demo only, so it's not quite the real thing) with STiNG, MiNT/N.AES with MiNTnet, STiNG and GlueSTiK.

* _None_ of these combos are faster than the others with my 33k6-modem, on average they're equally fast. STiNG works with all TOS/MagiC/MiNT-versions I've tried it on, but has a limited number of clients available. The speed is top-notch, I get about 3.7Kb/s with aFTP.

* MiNTnet only works with MiNT (but with all MiNT-compatible AESes) and is equally fast. It has tons of clients though, and is ATM the only stack/OS which supports basic things like NFS and SMB, very important stuff in a LAN. Nothing to get exited about if you only have a single machine connected to the net with a modem.

* IConnect is also equally fast, works with both MagiC and MiNT/N.AES although the latter requires lot of tinkering and experimenting to get working. It has virtually no clients.

Now, this is with a 33k6 modem with 56k7 DTE-speed, what happens if I connect the TT to my Falcon with a nullmodem-cable?

* Both MiNTnet and STiNG peaks at about 10Kb/s (115k2, I haven't tried 230k4 yet because of my poor cable), IConnect refuses to connect (it seems like it *requires* a modem) so I don't know how it performs at this speed.

> always telling people to move on? You don't believe me, well, a couple of
> days ago I told this story in a other posting, all the reactions agreed.
> No one guy saying it wasn't true, not even your precious gang. Hard to
> swallow I gues that MagiC and his applications beats the rest.

I guess I missed that one, but I can assure you: When it comes to functionality and flexibility, nothing beats MiNTnet and MiNTOS. The price you have to pay is increased complexity and a steaper learning-curve, but if you need something more than just simple Internet-services then there's currently no other options. Period.

I've been on the net with my Falcon since the very first days of STiK, and I've tried almost every available TCP/IP-package available so I believe I

know what I'm talking about...

> one to go on the net, but now it is outdated, aren't you the one who's

The "outdated" technology found in MiNTnet and it's surrounding environment is what serves the entire Internet, you won't find any dial-up toy-stacks there... (OK, that was a bit arrogant, but also quite accurate.)

> Lets talk about the 85%, which is not connected, what do they do with
> their Atari, what applications are they running, what OS? I don't know and

> couple of hundred versions of MagiC they would pack it in (Cherish the
> thought). There must be thousands of people using MagiC, all content, and
> not complaining, and yet according to You they are DUMB, BLIND and
> INGNORANT. Sorry Katherine but I think it's the other way around

The major commercial market for Atari-machines and software is Germany, and the majority of the "power-users" (i.e. people that actually cares about multitasking, upgrades etc) are either on the internet or mausnet. Have a look at the maus-groups and you'll see a completely different world than these UK/US dominated newsgroups.

Those that know that MagiC even exists also know perfectly well how to get on the internet, as both MagiC and internet-apps are advertised and pushed through the same channels.

The thing about "I-Connect is the only PPP-capable stack on Atari" is
probably the best joke I've ever hear.

> #3 rule, in addition to that, make ENGLISH version of DOC and OS, giving
> full support for other country, Hence more revenue.

Interrestingly enough, I just e-mailed Oliver Buchmann of ASH yesterday,
to request English programming docs for Magic. His reply? "Sorry, there
is none" ...

How the hell do they expect people _outside_ Germany to actually support
those MagiC nicies, if they never bother with the non-german world?

> #4 rule, keep a backward compatibility, not denying some simple calls
> already implemented years ago.

Obviously, Andreas really should implement those few AES 4.1 features
that are still missing and upgrade his AES version accordingly. Why he
stubbornly refuses to do so is completely beyond me.....

> #5 rule, advertize intelligently in effort to get NEW people, coming from

WASHINGTON (AP) - In a second day of testimony, the government pointed out new problems Wednesday with a video demonstration prepared by Microsoft in its attempts to back up a key point in its antitrust case. By day's end, Judge Thomas Penfield Jackson, who will decide the antitrust case against the software giant, shook his head to admonish a key Microsoft witness: "I can't rely on it (the video). It's very troubling." Over a four-minute segment, a government lawyer pointed to software icons that appeared - then disappeared and reappeared - on the screen of the computer purported to have been tested. Under questioning by Justice Department lawyer David Boies, Microsoft senior vice president James Allchin acknowledged Microsoft had tested several computers, but edited together video segments so it appeared a single computer was being tested during the video demonstration. Everything depends on what you want to do. Only the Falcon is really
suitable for Audio apps. The others just don't have the horsepower or the
hardware. MIDI is another question though...

Yes, NVDI runs with just about anything. It accelerates the VDI calls, that
is the part of GEM which is in charge of drawing lines, blitting, scrolling,
etc... It also includes a maccel equivalent and speedogdos.

It should run with Magic and Notator without any problem.

Hi Geir!

You might be stronger than me, but I can still beat you a couple of
times with a baseball-bat and then outrun you ;-)

Seriously, you know as well as I that we use our Falcons for entirely
different things, and you also know that MagiC simply can't do what I
need my OS to do.

I actually wrote a long reply to this, but when I tried to post it
(Dejanews) my internet-connection failed (that bllody firewall...).

In short: Geneva and MiNT is *not* a stable, usable combo. Why blame
this on MiNT/MiNTnet?

Cubase (at least the Atari versions) can import Pro24 songs and then save them as midifiles. I'm not sure if Pro24 can save as midifiles (it's been too long since I upgraded... ;)), but I believe it's possible.

> also?

There is no "conspiracy against MiNT-users", but ASH is clearly
pushing MagiC by making their apps more and more MagiC-dependent, even
when it's not necessary. E.g. ASH Emailer check for the presence of
MagiC instead of the features it needs (and other OS' offers).

> way Texel ? Not really, So let us be glad that ASH is still supporting
> the Atarimarket, giving the developers the chance to continue developing

Ofcourse I'm happy that our platform is still commercially supported,
but there are other publishers that does not use the dubious marketing
that ASH use.

>>of these *require* MagiC as ASH marketing says?

> No they do not, but what ASH is saying is if You want to get the best
> performance out of these apps, they should be run on a Multitasking OS. I

Nononono! They say that "this and that runs under MagiC". Have a look
at their products-overview, do you see any references to anything else
than MagiC.

"Phoenix - das relationale Datenbanksystem fur MagiC" ("Phoenix - the
relational database system for MagiC").

"CAB - Der Web-browser fur MagiC, MagiC-Mac und MagiC-PC" (No
translatation required...)

> find it only normal that they recommend Magic, it would be quit strange if
> they recommended something else....Philips recommends Philips CDR for their
> CD Writers. JVC recommends JVC VHS Tapes for their videorecorders.....

..but Philips does not say "Philips CDR - the CD-writer for Philips
CDs".

> easy, even the biggest dummy can install it. If one wants to install Mint or
> one of the derivates it takes a lot more then typing in a registration code.

Installing MiNT + N.AES takes *one* drag'n drop operation. Newer
version (Milan MultiOS) is also shipped with a simple GEM-installer, I
have not tried this so I don't know how well it performs.

> So as long as the installation is user unfriendly, and there is no proper
> channel of distribution, I'm afraid Mint and co. will always play in second

I'm afraid you really don't know what you're talking about :-/

> widely used and since it runs on Mac and PC some developers actually develop
> their apps on a Mac running MagicMac. That's what I meant when I said to
> Katherine and the others: "welcome to the real world".

OK, so Ataris are not a part of "the real world" anymore? Good for me
that I have a (bloody expensive and rarely used) piece of the real
world on my desktop in addition to my Ataris...

> The most important thing however is that the OS stay compatible. Who should
> set the standard? Well that's what the MAGIC vs Mint discussion is all
> about. MagiC is marketleader and if it should become the standard, it's easy
> for the various developers; One publisher sets the guidelines. If Mint

Bah! Try getting *documentation* on MagiC! I'm sorry, but the easiest
way to develop for a particular platform is by having readable docs on
it.

> becomes the standard I'm afraid there's going to be chaos. Just have a look

Why do you think so? Do you believe that the kernel-maintainers are a
bunch of cowboys, adding, removing and changing features at will?

> into a typical ftp archive; open up the Mint directory and it's clear to see
> for all: chaos. Different derivates, different rules, different docs and
> even different installation apps and procedures......

Eh? Please explain, I really don't understand what you're talking
about here.

> Atari users have come a long way, the last ten years have been tough, we
> all are a special breed with the same passion, we should keep it that way
> for at least the next ten years to come.......

In ten years there's no ASH, and unless the sources for MagiC are
released to the public the scene will die if everybody switch to
MagiC.

> We even see pigs fly on a fridaynight -))

I hope to spot some this weekend.

Well, that's not really fair.....:) Any Atari news in print is fun to read.
Sometimes reading Consumer Reports stears you away from bad purchases on your
part;). It's big and glossy, and with the way some of the Bigger advertisers
layout their adds, one would think you could run to the store and pick up the
product.

Ummmm, some of the advertisers.......... That could be the start of a good
(?) thread.

Install BetaDOS, and you have MagiC6-compatible shared libs under TOS,
Geneva and MiNT as well. Now, let's try find some apps that actually
use this feature...

> Also, I didn't know that menu_register() was any different under magic
> than MiNT. Can anyone confirm that? Is it supposed to be the same call?

It's different, MagiC doesn't support menu_register() in apps, only
accs (just like plain TOS). Using it doesn't seem to do any harm
though, it just don't have any effect.

> Please, oh please, tell me how you convert a JPG into a 16 col grayscale
> GIF scaled down with a factor of 1/4th with IMAGECOPY.
> I am very curious.

1. Load the picture, zoom out and grab the downscaled image from the
screen.
2. Convert the grabbed picture to 16 grayscales.
3. Load the converted grab and check it out.
4. If it looks horrible, then fiddle with dithering and go to (1)
5. Repeat until you're satisfied.

It works, but Imagecopy is clearly not designed for such tasks.

2318. MiNT and STinG

Newsgroup: comp.sys.atari.st
Date: 1999-02-04 00:00:00 UTC
From: hassen_tos@my-dejanews.com
Message-ID: <79cti0$40v$1@nnrp1.dejanews.com>
Source record: 85034

Hi. I'm still new to these forums so please forgive my ignorance if what I am asking is common knowledge. I have a 14MB Falcon030 and I want to connect to the Internet using my Atari. I purchased MagiC 6 and CAB 1.7 since I was told that they would be all I need to connect. Unfortunately, MagiC will not run at all: it keeps giving me an error in German stating that it can't find the screen drivers. I have posted several questions to the MagiC mailing list without any help at all. Naturally, that was not money well spent. I hear that there will be version ready for the Milan, but I am frustrated that they cannot get it to work on a TOS machine. Anyway, I digress.

I am able to run MiNT and I downloaded STinG. Everytime I load up with Multi-TOS, I get an error that quits the COPS accessory. Now, I am not able to get the dialer of STinG to run. Is there something I'm missing? I tried checking out the FAQs in the help file, but most of them are blank and a lot of times they just close out the ST-Guide program.

Any help is much appreciated since I have been trying to connect for about five weeks now. If you prefer to email me directly, my address is hhammoud@rci.com. I will accept help for any of my problems listed above. Sorry for such a long post, but I am getting pretty frustrated and I would like to show myself that I'm not crazy for keeping my Atari and not buying a cheap wintel clone.

Thanks in advance for your help.

Hassen Hammoud

Let me give an example. My brother has used for years a TT030 but recently
he bought himself a Mac G3. As he had the intention to use his Atari
application suchs as Calamus SL95, Phoenix and Word Plus 5 he bought also
MagicMac but has he ever used it? Only Calamus SL 95 is he still using but
if I can't find a solution for his printing problem he probably will
switch over to Claris Works which suits his needs very well. Phoenix and
Word Plus are replaced by some Mac applications.
Since he has his G3 he didn't spend a dime on newer Atari applications.

This is correct, but it's also correct that whenever there is a
OS-specific article it's usually about MagiC. And there's no question
where the screenshots are taken. So I have no problem understanding
that people feels that AC is MagiC-oriented. Heck, I feel so myself,
but I'm not canceling my subscription ;-)

My German is poor, but doesn't he say that it will *run* on the Milan
this month, and not that the Milan-version will be *shipped* this
month?

Now all that's needed is some network-support, and MagiC might be
usable ;-)

I have an Atari ST 1 Meg with SM124 mono display and 20 meg hard drive, Panasonic 8 pin impact printer and some software (notably, Prolog). As far as I know, all this equipment works, but it has not been used for several years.

I'm happy to donate this system to a good home or cause but I'm very busy, so please note:

1. I can't ship this equipment and I want it out of my office at UBC in Vancouver, Canada, w/in a week or so.

2. I don't read this newsgroup, so contact me by email. I'll donate the system to the best home or cause.

3. I don't have any time to devote to this, so don't email me unless you have want to apply for this system in a cooperative spirit.

```
The Forget-Me-Clock software has been identified as a major victim of the
Y2K bug. There seems to be a workaround to it, as the cartridge itself
should be able to go through. Check out the link on the subject in the Quick
FAQ

You would have to be able to run Pro24 on your emulator, but I don't think
this will work (because of the dongle copy protection).

I had exactly the same problem when I tried to install it on my Falcon. I couldn't find out what went wrong, gave up the project and installed it on my TT instead. Surprise, no problems on the TT...

I have a graphics-card on the Falcon, this requires it's own VDI which might be a part of the problem, but a friend of mine is happily running MagiC6 on a Falcon almost identical to mine without any problems at all.

The screen-drivers are definitely present (check c:\gemsys for the mfa*.sys files) on my Falcon, and even with both the graphics-card driver and NVDI disabled I got this message. I even disabled everything (including the Afterburner-driver, so I was stuck with no fastRAM and no caches) but the MagiC-loader and still got this message. As I said, I just gave up and used my TT instead.

There is probably a simple solution to this (Geir, have you ever had this problem?), but I was unable to find it.

> I am able to run MiNT and I downloaded STinG. Everytime I load up with Multi-
> TOS, I get an error that quits the COPS accessory. Now, I am not able to get

Do you have wdialog and NVDI properly installed?

> the dialer of STinG to run. Is there something I'm missing? I tried checking

This depends on which version of MultiTOS you're using. The original (AES 4.0, no iconify) is incredibly slow, but STiNG works fine with it. AES 4.1 (beta, has iconify) is a lot faster but apparently STiNG is not too happy with it. For some strange reason it has always worked fine when I've tested it...

2331. Clocks and St1040's and music software

Newsgroup: comp.sys.atari.st
Date: 1999-02-05 00:00:00 UTC
From: claude boux <cboux@sprint.ca>
Message-ID: <01be5113$595195a0$071867d1@claude>
Source record: 84846

Hi !

Please forgive my ignorance, but, I have been using my Atari 1040 St with the Master Tracks Pro software designed by Passport for roughly eight or nine years.
My question is simple : does the internal clock in my Atari affect one way or the other the use of the software ? Will I still be able to use the midi set-up (Atari-Korg M1) in the year 2000?
When I click on "Control Panel" and check the date , the clock reads : 4/22/87. So, my feeling is that this internal clock does not interfere with the actual use of the Master Tracks software, but as I am not an expert, can anyone out there confirm this for me ?
Thanks for your help.

> or the other the use of the software ?

Guess what: There is no internal clock inside a 1040ST !! Unless you
have installed an aftermarket RTC (Real Time Clock), each time you
switch it on the system thinks it's somewhere in September 1987. It
will keep on acting the same way until well beyond 2000-01-01.

> Will I still be able to use the
> midi set-up (Atari-Korg M1) in the year 2000?

Think about this: Which part of your MIDI software checks the system
date ? Does your Korg M1 keep track of your appointments ? Does you MIDI
software keep an internal database with the time and date of creation of
music ?

The truth is there is a lot of hype about this Y2K thing. When there is
no datekeeping functionality, there is no bug.

> When I click on "Control Panel" and check the date , the clock reads :

Take it easy. Calm down. Get a beer. Make music. You've got nothing to
worry about. It's only if you had a PC that it would time to panic!

> I would like to know what Wdialog is supposed to do though.
> It came with Magic 4.

Essentially W gives M AES & VDI functions away to other OS's,
so its really part of apps that are written with M in mind but want also
run on non M.
I updated M 5 to M 6, and there was no new W with it.
I updated NVDI 4 to NVDI 5, and lo & behold, there was a 3 times bigger
W with that.

Cheers
Henk.

2335. TOS 2.06 upgrade

Newsgroup: comp.sys.atari.st

From: Jason Whorton <jason@microxl.com>
Message-ID: <79f0vj$117$1@remarQ.com>
Source record: 84850

Hello. I have an Atari 1040STe and I think it has the TOS 1.04 ROM's. What benefit would I gain from upgrading to TOS 2.06? The Quick-FAQ states, "TOS 2.06 is the latest version that can be used in an ST(e/f/fm)." and "Upgrading TOS from a 2 chip version to a newer 2 chip one is quite simple, provided you change two jumpers on the motherboard (W102 and W104)." Does anyone know of a place or person that sells the TOS 2.06 chips besides Best Electronics? I think they wanted $60. That is more than I am willing to pay, upgrade or not. If anyone can help me out on this, I'd appreciate it. Please post it here and/or e-mail me.

Thank you,
Jason Whorton

The main difference with TOS 2.06 is the new desktop. It allows placing
program icons (like Win95's shortcuts) on the desktop. It also handles
drag'n'drop, you can change the window background style and colour and
set your own icons.

TOS 2.06 also has some hidden features that make it a mandatory upgrade
of you want to use an internal IDE drive like the TUS IDEal board, or if
you want to go beyond 4Mb RAM with the Magnum board.

<snip>

I'm afraid that's the going price. Maybe you can find them slightly
cheaper. You can also go the pirate route and burn them yourself if you
find the image file.

The problem is probably that ataboot doesn't recognise the SST's
fast-RAM. If you have any specs on this accelerator (most importantly:
where the fast-RAM is mapped) you should notify the ataboot-maintainer
(whoever that is) and he'll probably update it.

Hi

I'm desperately after a monitor switch box, the one that has the 2
monitor inputs as opposed to the multisync switch box.

I'm looking at around a fiver or I'm willing to swap some software or
whatever for it.

This is urgent as I can't test any software on a colour monitor without
it, the joys of having an ST in a tower case:(

2343. Jaguar Development Kit

Newsgroup: comp.sys.atari.st
Date: 1999-02-05 00:00:00 UTC
From: Laurent FAVARD <l.favard@france2.fr>
Message-ID: <36BB232D.4BCF1D22@france2.fr>
Source record: 84858

Hi everyone,

we are happy to say that the first release of JagStudio is available
just for test and to look what is it at:

http://wwwlinux.utc.fr/~atari/

This software is the (main) part of our Jaguar Development Kit project,
which we are working on.

Currently, it won't work on TOS and others but only MagiC, but cause
this choice seems to be so "hard", i will modify JagStudio as soon as
possible to make it more "friendly" with TOS 4.0x (Falcon).

Unhappy, these web pages are in French, VERR SORRY, but if think that
we'll do an english version, for this nice small project, at least in a
first time.

For software: l.favard@france2.fr
For Hardware: Sebastien.Favard@hds.utc.fr

(You can contact us too, at: atari@linux.utc.fr)

Now we are await to any suggests...
Ciao !

2345. Mint install problem

Newsgroup: comp.sys.atari.st
Date: 1999-02-05 00:00:00 UTC
From: binson@pikes77.freeserve.co.uk
Message-ID: <79fc8uurg1@news7.svr.pol.co.uk>
Source record: 84860

Hi
Bit of info required if someone knowledgable would assist please
Had a spot of bother with installing MINT
Had to get minix partition back to TOS to try to
re-install mint but the partition rebuild failed.

I have HDdriver 3.51, Diamond Edge 1.10, HDX 5.01
are these sufficient to maintain a new 4.5gig hard
drive. I hope I can:
INSTall MINT,then access all of the hardrive and maintain
harddrive.
Harddrive has been up and running, but had only
TOS with 12partitions each holding 255 meg.
accessing only 3gig of new harddrive. I think
magic give more drives but prefer have a go at mint.
The hardrive is at present down,as of MINT attempt
I have full backups
ready to install, but am unsure the said programs are
really the right tools for the job, MINT was attempted
on one of the big partitions :ie 255meg, bit big I thought?? but
had no other option. Diamond edge gives strange scussi ids
and hdx can't scan devices. What corrective procedure should I
implement.
THANKS

Regards Bill

Thankx for the help
i still have a few Questions.

If i download the software, can I just unzip it to the disk?
Does atari also support a unique filesystem (aka not DOS's FAT16)
What is a store expansion?
Why should I get a mono monitor when I already have a color one?
What are MagiC and MiNT, and does MiNT run TOS applications?
Should I get a new version of TOS, and is it easy to upgrade?
Is it possible to obtain all this stuff in the USA, and if so where?

Thanx.
Jon Striley

Also, how does the performance of an ST1040F rank with modern computers.
It sounds like you can acces the internet, program, do sound and graphics,
etc with them. This seems starnge to me, sine it is at least 15 years
old. Would I be better off getting a newer atari? And if so what model?

You can simply zero the partiton with HD-Driver or Edge.

> I have HDdriver 3.51, Diamond Edge 1.10, HDX 5.01
> are these sufficient to maintain a new 4.5gig hard

I suggest you upgrade HD-Driver to the latest version, this will allow
you to use huge FAT32 (as in Win92 and NT) partitions with MiNT.

> INSTall MINT,then access all of the hardrive and maintain
> harddrive.

Shouldn't be a problem.

> Harddrive has been up and running, but had only
> TOS with 12partitions each holding 255 meg.

You can have upto 14 partitions (c-p) with TOS and MiNT.

> accessing only 3gig of new harddrive. I think
> magic give more drives but prefer have a go at mint.

You really don't need more partitions, but *bigger* partitions. MiNT
can handle big partitions without problems, so can MagiC.

> really the right tools for the job, MINT was attempted
> on one of the big partitions :ie 255meg, bit big I thought?? but

You mean MinixFS? I have one 280Mb and one 400Mb minixfs-partition,
so 256Mb is no problem.

> had no other option. Diamond edge gives strange scussi ids
> and hdx can't scan devices. What corrective procedure should I
> implement.

HDX is very limited, and Edge will choke on anything but plain
TOS-partitions.

I believe your problem is your outdated HD-drivers, I'd recommend the
latest HD-Driver.

>It is possible to gain 50 and lose 3 so why are Atari Computing
>getting so upset and being so nasty with everyone just because they
>dare speak about something.

No one is being nasty as far as I can see. Katherine has apologised for upsetting people, she didn't upset me, she tells it as she sees it. However, it is very wrong for people to say things when they have no real basis in fact. Worse still, some of the few people saying these things don't even read the magazine!!! If AC didn't reply to these comments we would be accused of ignoring people - we really can't win can we?

However, if you tried to publish a magazine for the Atari market and had people sniping left right and centre at you for covering certain things, I think you'd feel more than a bit aggrieved. We are always happy to cover ANY part of the Atari scene, but we rely upon YOU, the Atari user, to write articles, feed us information and generally be positive about all things Atari. We've asked numerous times for people to contribute to the magazine, but we've never been offered anything on MiNT, that's a shame, but it's up to MiNT users to come up with the goodies.

I'd give up AC right now if I thought sensibly about it, as would Joe Connor, but we won't because despite the unpleasant, and often totally untrue, comments aimed at us, we have an extremely loyal bunch of readers that actually like what we do. If they deserted in droves, then I'd seriously think we'd gone wrong somewhere, but as they don't, I'm inclined to believe they're reasonably happy with things as they are. However, there's always room for improvement, and constructive criticism is the way to help it happen. Posting half truths and total untruths is definitely not the way. We do take onboard constructive criticism, many changes in the magazine have come about because of such criticism - do you read the magazine Alf?

I think I've said enough now, the offer is there for anyone to contribute to the magazine, somebody take it up!

So to plagarise and alter Katherine's sig:

'Atari Computing is Atari Computing, let's move on shall we!'

:-)

Kind regards

Mike Kerslake

> If i download the software, can I just unzip it to the disk?

Yes. Download ST-Zip for this.

> Does atari also support a unique filesystem (aka not DOS's FAT16)

What do you mean here? Depending on what you use (TOS, MiNT or MagiC)
your Atari can access many types of filesystems:

* FAT12/FAT16 (TOS, MiNT, MagiC)
* VFAT (MiNT, MagiC)
* FAT32 (MiNT)
* MinixFS (MiNT)
* ext2fs (MiNT)
* CD-ROM: ISO, Joliet, HFS, audio (TOS, MiNT, MagiC)

> What is a store expansion?

I guess he means a RAM-expansion.

> Why should I get a mono monitor when I already have a color one?

Because mono-monitors have a resolution of 640x400, while you can only
get 640x200 on a colour-monitor. The problem with the latter is that
the aspect-ratio is all f**ked up, so lots of programs will look at
bit odd.

> What are MagiC and MiNT, and does MiNT run TOS applications?

MagiC and MiNT are TOS-compatible, multitasking operating-systems.

> Should I get a new version of TOS, and is it easy to upgrade?

If you plan to use plain TOS then you should get atleast TOS 1.04,
preferably 2.06. Installing 1.04 is a matter of swapping the old ROMs
with newer, 2.06 is more expensive and complicated.

If you're planning to use your Atari for more serious stuff, I
recommend that you get yourself a second-hand Falcon with 14Mb and a
internal harddrive. Then you'll have a compact, reasonable fast
machine which is capable of running MagiC (1) and MiNT/N.AES (2). It
also has much better graphics, very good sound and is more easily
expanded than your ST. It would also be both cheaper and easier to get
a Falcon than adding more memory, a harddrive etc. to your ST. And it
will be able to use your original colour-monitor in resolutions like
768x512 in 65000 colours :-)

The Falcon has it's quirks, but it's generally a very enjoyable
computer.

(1) MagiC has problems on many Falcons, so if possible, try before you
buy.

(2) Look at 'http://www-atari.nvg.ntnu.no/n.aes/' for more information
about N.AES. You should also look at 'http://www.milan-computer.de/',
the Milan runs N.AES

If it's an STE then it will have TOS 1.6 (1.06) or 1.62, the STFM's can
have 1.0, 1.2 or 1.4.

>from K[GE]MD.

I always run Screenblaster before MiNT. The docs for SB1 and 2 both
say it should be betweem NVDI and MiNT.
I get no crashes and can change res it gives me the SB res list with
out problem.

Rich.

Do you want another example? Just try to run Papillon 3.x with NVDI older
then v5. Won't work at all.
The desktop Jinnee needs Wdialog otherwise no way you can use it properly.
Cops needs wdialog otherwise no go.
Furtunately CAB still runs without wdialog or NVDI.

The way ASH do business sucks

<36BB3C4A.5D3FB387@ix.netcom.com>...

> i still have a few Questions.
>
> If i download the software, can I just unzip it to the disk?

Yes.

> Does atari also support a unique filesystem (aka not DOS's FAT16)

On floppies, Atari format is almost identical to MS-DOS. Ataris read DOS floppies no problem but not the other way round. However later TOS versions (1.4 on IIRC) format DOS compatible by default. If you have an old TOS, format the disc on a PC to be on the safe side.

WRT hard drives, normal TOS partitions are not DOS compatible, however if you use late versions of HDdriver (commercial software) as your hard disc driver, you an format partitions as compatible with both TOS and DOS. This is mainly of use to people swapping stuff on removable media such as zip discs.

In addition, both MagiC and MiNT support VFAT long filenames, and MiNT supports FAT32 and Minix file systems (the latter for when it is in Unix mode - see below).

> What is a store expansion?

I think Roger just meant RAM by this. Take it to 4 Mb (max possible without serious surgery) in one go if you decide to expand it.

> Why should I get a mono monitor when I already have a color one?

Because on an ST highest colour res is Medium, 640*200 in four colours (ie not much better than mono anyway), complete with weird stretched pixels etc etc. Mono monitors run in ST High res, 640*400, square pixels. This is the minimum usable res with some newer software and infinitely better to work with than Med res.

> What are MagiC and MiNT, and does MiNT run TOS applications?

MagiC is a complete replacement OS, fully multitasking and faster than TOS on slow machines (ie ST family). However it's commercial, not free.

MiNT is a TOS extension (though on its way to being a full OS replacement), which makes TOS fully multitasking, though only for text apps unless you add in a multitasking GEM AES to the equation, such as Atari's MultiTOS (they used MiNT as the basis for MTOS) AES 4.1 (widely available unfinished

update for MTOS), Geneva (commercial) or N.AES (commercial). MiNT itself is free, and canbe had in various installation packages if you want the full Unix works.

Both MagiC and MiNT run TOS applications, though some older apps don't get on with one, the other or both. MiNT also has a Unix mode, allowing it to run ported Unix apps if you set it up to do so. Hence the Minix file system mentioned above (not needed for multitasking TOS apps).

> Should I get a new version of TOS, and is it easy to upgrade?

If you were going to shell out money for a TOS upgrade anyway, you might be better going for MagiC or N.AES/MiNT, but only if you upgrade the RAM.

> Is it possible to obtain all this stuff in the USA, and if so where?

Yes, but I'm not sure about US dealers myself.

<36BB3D0E.EB5C8BE3@ix.netcom.com>...
> Also, how does the performance of an ST1040F rank with modern computers.

Slow in absolute terms (ie number crunching etc), but highly usable due to sensible OSs. I recall reading some time ago that a good comparison (in terms of "feel" rather than hard benchmarks) for an ST was a 386/25. However my STE with MagiC and NVDI and sensible apps used to feel pretty much as quick as the 486/33 I was using at work a few years back, particularly WRT screen redraws.

Scientific comparisons are harder to achieve, due to apps being different etc. atari apps and OSs make much fewer demands on the available hardware.

> It sounds like you can acces the internet, program, do sound and
graphics,
> etc with them. This seems starnge to me, sine it is at least 15 years
> old.

Old, but well designed. Hence you can indeed do all those things, though later Ataris do some of them more comfortably. However an ST with suitable upgrades to RAM and OS will do most things.

> Would I be better off getting a newer atari? And if so what model?

Possibly. It depends what you want to do.

The Falcon is the one for sound, also graphics as other machines will need a graphics card to match Falcon graphics modes. However the Falcon is slower than the TT, which is the Atari to have for speed. TT+graphics card will match a Falcon for most things apart from sound stuff, likewise the newer clones (Hades, Milan). Note there are also accelerated Falcons and TTs around, too.

If you already have a PC or Mac you might also be interested in emulators: MagiC is available for both, Gemulator is another commercial one for the PC and there are freeware/shareware emulators for both platforms too.

>

Actually ataboot does recognize the SST's fast-RAM and SST's fast-RAM
actually resides at exactly the same memory location as the fast-RAM on a
TT. I know that this isn't the problem because the computer freezes even
when I try to boot without the SST fast-RAM installed.

2367. Sting problems ?

Newsgroup: comp.sys.atari.st
Date: 1999-02-05 00:00:00 UTC
From: John Whatty <john@mevatele.freeserve.co.uk>
Message-ID: <36BB7585.76A9@mevatele.freeserve.co.uk>
Source record: 84882

Hi there
I'm trying to connect my STE to the net.
Its a 4Mb STE with internal 720Mb drive, HD floppy and upgraded serial port, TOS 2.06 running NVDI.
I'm using HSmodem and Sting, latest versions off the net. ISP - Freeserve
I've got Sting connecting to the net Ok, but after about 20 secs the modem hangs up. This happens every time I connect. I tried another modem and its just the same.
Have I missed something simple in the config or what ?
Any help greatly appreciated.
Cheers
John.

Attaching should not be problem, but DOS will not recognize your Atari
partitions, without special driver, which not exists, as I know. Other way -
working with DOS partitions on Atari is supported.

Is there any reason not to use Linux? And can I dual boot Linux and TOS or
mint or something? I guess I'd just switch disks. I just wondered becuase I
run Linux and Win95 on my PC, and Im familliar with it.

Thanx,
Jon

I too used to do that, but I never will again. Mine was a Syquest 105,
which had one disk in it for some long time. Put another disk into it, and
then my troubles started. They got worse, quickly.

So, I took it apart to see what was wrong with it. The bearings were fine,
which is probably why it cost so much. But one head was almost broken away
from its glue hinge, and the other had the wire to the head broken off at
the head coil. That one had a larger than normal connection blob between
the wire to the head and the wire to the head amplifier.

Both of those things I attribute to long duration, low amplitude vibration
from the little bit of runout in the Winchester disk.

Right then, I reached over and hit the eject button on my ZIP drive.

One small arguement for ICD's disk driver is that you can boot with the
drive recognized, but not with a partition number, put in a disk, run the
start HD program, then the relog program, and the disk should be recognized,
and the icon should work.

But I never will again leave a disk spinning in a drive when I can
avoid it.

I think I am learning really quick. Something was indeed very wrong. Now
the missing partition has reappeared and the drive shows as complete 270meg
as opposed to the 256 before. The second partition was taking forever to appear
and now it appears instantly. I have done nothing but remove the cartridge
when done. I was using the working partition for unarcing files. Now everything
appears ok and the cartridge will even format perfectly. I have no idea on
the inner workings but I remember the flicking light sticking on as if the
head was stuck in one spot.

Regardless of the meaningless information, I am removing the cartridges before
shutting off the computer.

Brian.

I use Wdialog with NEWsie just fine thanks.
However there is alot of things Wdialog doesn't like.
I would like to know what Wdialog is supposed to do though.
It came with Magic 4.

Toros; 1966(6), 1967(7), 1968(1), 1969(2), 1970(1), 1973(2), 1975(1).
Plus a couple of 67 Eldorados.

The 71-78s have running gear that will fit the 66-70s, that's the
only reason I have them. My daily road iron is a '67 Toro.

I raced on a dirt circle track with a couple of Loewy coupes back about
1965-66. Held the track record then, and broke a lot of rear axles.
They're kinda flimsy in torsion with that keyway that drives the brake
drum. Other than the cheezy rear axles, it was a great racecar.
Unfortunately, our rules disallowed changing to another rear end assembly.

>Good luck with Power Print! Hasn't failed me yet...
>
Sounds like the answer for my purposes. I'm keeping my TT, and I can use
it's printer for the Mac as well.

Bill

Hallvard,

I'm amazed at how fast the MagicMac copies floppies. I havent timed it
against my TT, but I can tell it's much faster.

My Mac has a small monitor, I'm looking forward to getting something
bigger. I'm using a TTM195 now, and wonder what it would take to
simulate it in the Mac.

I don't think you need to do that. Anyone with a half good news
reader can skip the thread entirely by looking at the headers. I much
prefer this thread instead of platform wars, the thread you are sorry
for at least gets some facts known and other issues cleared up. Maybe
in a somewhat harsh way but you'll have that where there is passion
for something. ;-)

>. HI!

The only way I know of is to get hold of Atari Cubase, which has a
funtion to load pro24 (and twelve) files into cubase and from there
you can export as a midi file. I do not believe there is a
"stand-alone" utility for this. Another alternative is to find a
friend who has an atari with Cubase installed and have him(her) do the
transfer for you.
Hope this helps

A good source for drums and toner is B&C Computer visions

http://www.myatari.com

You can a two pack of toner for about $30.00

The drums I think are more expensive..about $120.00

Check out the web site for more details.

2392. PC keyboard -> mega ST?

Newsgroup: comp.sys.atari.st
Date: 1999-02-05 00:00:00 UTC
From: db361@torfree.net
Message-ID: <F6o0Hw.7sG.0.bloor@torfree.net>
Source record: 84928

I know that Alex Yu and others marleted the DEKA which allowed one to hook up an IBM-type keyboard to a 1040 or to a Falcon0303.

is there such a gizmo for Mega STe/TT030 computers? As it stands mega ST's are all having their old mega keyboards taken away every time a TT or Mega Ste develops a break in the key mylar. We now know that this is inevitable, so the supply of Mega St's will eventually dry up due to the cannibalization. I say this becuse I just cannibalized a Mega ST2 in that manner for one of my machines.

It is a problem. Is there a solution?

Mario, you should build an interface!

The zoom OUT of Imagecopy is HORRIBLE.
It looks like crap. Zoom IN is ok though.
Grab picture? oh then you mean that the picture once grabbed will be the
color depth your screen was. In example, you are in STHigh resolution,.
Take a grab, what is your picture gonna be? 16bit? 24bit? or 2bit?

> 2. Convert the grabbed picture to 16 grayscales.
> 3. Load the converted grab and check it out.
> 4. If it looks horrible, then fiddle with dithering and go to (1)
> 5. Repeat until you're satisfied.

On my system COPS was unstable until i installed NVDI. Strange one of their products require antother one (2 if wdialog counts) to work properly. Sad, really..

2398. Centek announcement

Newsgroup: comp.sys.atari.st
Date: 1999-02-05 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <36bab9d84170a001@holleman.demon.nl>
Source record: 84934

Hi,

the 1st of February Centek posted the following in Mausnet.mint_mtos.
Since I gather not everyone got this NG hooked up, I thought it might be
of interest to repeat the message in here:

The last news about the PHENIX 040/060

At the end of December, at the very time when the E15 version of the
PHENIX motherboard was ready to be produced for the developers, CENTEK
decided to bring some important changes about the hardware architecture
of this motherboard.
Here is the list of the major changes introducing the R1 (Rev.1) version
of the PHENIX 040/060:

- The DSP56301 is now connected on the PCI bus.
- A card with 3 other DSP could be plugged into a PCI slot, not into a
dedicated slot.
- The ULTRA-SCSI and USB (2 ports) controllers have been replaced. The
new ones are connected on the PCI bus.
- Two IDE (ATA-4) connectors are now officially provided thanks to a new
component on the PCI bus. Four peripherals are so possible.
- The MIDI, SERIAL & // ports are suppressed. They are possible with
some USB interfaces, opening the way of the future.
- The QUICC chip is suppressed.
- The EDO RAM is replaced by the SDRAM; it is 2 times cheaper and 2
times faster (with the 060).

Why these modifications ?

The first objective was to reduce the production cost: the suppression
of the QUICC and the transfert of some functionalities on the PCI bus (to
reduce the programmable logic cost) follows this objective.
The reduction of the cost continues actually to equilibrate the cost of
the performances increase.

The second objective was to take in count the remarks of some developers
(like Soundpool) in the domain of the DSPs. They was wishing to have
faster transferts between the DSPs. With the DSP on the PCI bus, the
hardware architecture is optimum.

At CENTEK, we were wishing to reduce as much as possible the necessity
of the CPU use to transfert the DATA. For that reason, the USCSI and USB
are too on the PCI bus.

The performances ?

Imagine the heavy task that reads a movie from a DVD disk.
The hard disd drive (HDD) (Ultra-SCSI or Ultra-IDE) transferts the AUDIO
and VIDEO DATA (MPEG2) to the controler (USCSI or IDE) that transferts
on the PCI bus with BURST at 132 MBytes/s to one DSP56301 to uncompress
(real time) the AUDIO and one (or more) other DSP to uncompress the VIDEO.
Each DSP sends the results to the final destinataries:
- the AUDIO to the 20-Bit CODEC (on motherboard) by the DSP-CODEC serial
link.
- the VIDEO to the GRAPHIC card by the PCI bus at 132 MBytes/s (BURST).

Conclusion: no important CPU intervention which continues to run into
the system SDRAM on the other side of the PCI-040 BUS bridge !
This is the undebatable superiority of the PCI architectured computers,
not like the simple 'PCI as peripheral' architecture !
Have a look on our functional block diagram.

The final objective was to draw nearer to this total PCI architecture
faster than it was previously planned to easely introduce the new future
computers like the PHENIX 2 (code name). The PHENIX is now comparable with
the architecture of the last generation of PC.

The choice of the new PCI components was the principal reason of a new
delay to terminate the motherboard. We now terminate the PCB routing...

2399. Help! Cubase users

Newsgroup: comp.sys.atari.st
Date: 1999-02-05 00:00:00 UTC
From: Adrian Bradshaw <adrian@usanda.co.uk>
Message-ID: <79elkb$157$1@newnews.global.net.uk>
Source record: 84935

Is there anyone out there who would be willing to convert some Atari Pro24 files to .MID format for me?

Sadly, I only have a PC now, and can't find a program which will read them (getting the files onto a PC disk is no problem - just reading .SNG files).

Any help would be greatly appreciated.

Adrian Bradshaw

That's been the overall attitude with some (not all of them, fortunately!)
of the people from the UK scene; the "touches pas ï¿½ mon pote" stance.

Every time someone says anything about the likes of Joe Connor, Dinesh
Bahbuta (I apologize if I accidentally misspelled your name, Danny) or
Tony Greenwood, the poster gets flamed and roasted immediately.

Even constructive criticizing is interpretted as a personal attack!
People don't even read the complete message and immediately reply in
flames...

Listen, I really appreciate what those people do, but facts are fact:

Joe Connor _is_ known to procrastinate cashing in shareware registrations
(he _is_ a busy man, but it doesn't excuse the longish delays people
constantly report) and (with his TransAction mates) in translating some
shareware people anxiously await.

Tony Greenwood _does_ have a peculiar attitude towards those that don't
share his views (even though his coding speaks for itself: that guy
does know about atari programming).

Dinesh Bahbuta _is_ known to defend either ones feverishly, even when
others' statements are obviously true and well-justified.

However...

I must say that I NONETHELESS ADMIRE ALL 3 FOR THEIR CONTRIBUTIONS,
especially Joe for trying to juggle Atari Computing, Interactive and
a rather demaning family life, simultaneously. Joe, where can I buy
a planner like yours? ;-)

Unfortunately....

Every time I read Atari Computing, I cannot help but notice that _all_
screenshots are from Magic, nor can I miss the "I am a MagicMac user"
vibe that has transpired since day 1, nor have I seen much of any MiNT
content ever.

So.....

Magic Computing, indeed.

> to setup HSModem too.

Correction: STiNG must run *after* MiNT. The correct loading-order is
HS-Modem, MiNT and then STiNG.

Generally MiNT should be the last program in the autofolder, but there are
some programs that must run after MiNT. STiNG is one of them, the
68882-emulator for Afterburner and various screen-enhancers (BlowUP, SB,
Videlity) are others.

The SST is too much of a hack, and probably not supported by Linux 68k.
If you want UNIX on ST variants, I suggest you install MiNT instead.

Start here: http://kellis.atari.org/

On 5 Feb 1999, it was written:

Sounds like a good idea, a "Autofolder FAQ" would be useful, especially for
newbies to alternate OSes like MagiC, MiNT and Geneva.

Here's a couple of things I know (doesn't) work. It's mostly MiNT-related,
'cause this is the system I know best:

* The various screen-enhancers for the Falcon must run after MiNT. This
applies to all I've tried, including Screenblaster II and III, BlowUp,
ScreenWonder and Videlity. Running them before MiNT results in anything from
subtle bugs to total crashes. Btw. SB3 does not work if you're using init.prg
from K[GE]MD.

* HS-Modem must run *before* MiNT. This is very important, as MiNT will
support it directly if present. This means that if you run HS-Modem after
MiNT, MiNT's serial-devices will use the old (and buggy) BIOS-routines and
not the enhanced drivers. Running HS-Modem after MiNT will work, but only if
you *never* use MiNT's serial-devices!

* Due to the way STiNG does it's internal scheduling it *must* run after MiNT.

* MiNT is a GEMDOS-replacement, and must therefore run after any programs
that provides extensions to BIOS, XBIOS or GEMDOS. Basically this means that
MiNT should execute as late as possible, only a handful of programs needs to
run after it (look above). There are some very good reasons for running MiNT
as late as possible, so please follow this advice!

* Graphics-cards and NVDI: The graphics-card driver must run before NVDI, and
generally you have to disable NVDI's own screen-drivers (they're usually in
c:\gemsys, just rename them). Btw. there is a program on my web-site
(www-atari.nvg.ntnu.no/software.html) that does this automatically if you
have a Nova card.

* Afterburner: The TK-driver must run before anything else, the only
exception is your boot-manager. Also, 68882.prg must run after MiNT.

* XBoot: If you run XBoot on a cached filesystem it will reorder your
autofolder alphabetically! So if you're using TCache or something similar
with a write-cache, then *never* run it before XBoot. This also means that
you can not start XBoot from your desktop to select another configuration if

your boot-drive is cached.

OK, I'm supposed to be working so I'd better finish here ;-)

Mine sometimes does this. My solution is to ensure the little lever
is really at the right of the slot, gently holding it there, if
necessary.

Cheers,
Charles.

I use a screensaver called "Screen-Artist" that is Falcon with FPU specific. It seems to run great, but get used to lots and lots of fractals -- most of the modules generate them. If you can find it, Twilight looked liked a good choice, but I've never been able to find it for sale (it wasn't released in the USA).

It was my impression that HD 7.5* (maybe 7.**) was able to read/write
and make DOS compatable partitions. Running BigDos and HD 7.5 may be
causing a conflict.

Jinnee and Cops work fine and very stable without the need of Wdialog
when using them with MagiC 5.11.As soon as I install Wdialog the
system becomes unstable.

Gordy.

>Microsoft(Internet Explorer)
>so maybe that is the problems! :-)
>ken

Hi Ken,

Three people had problems getting to the site, but found that the problem was because they were using a web browser to access the site, not an ftp program. CAB 1.5 works because when you type "ftp" in the url line, it automatically calls up Newsie (or whatever other ftp client you have set the ftp path to) and the address is accessed by Newsie. In all 3 cases, when this was mentioned, they were able to get to the site by using an ftp client. I think non-Atari browsers don't work in this manner.

I just upgraded from CAB 1.5 to CAB 2.7. Much faster, and it's nice to not have to mess with figuring out how to get around on pages that have frames. You should consider getting it.

Bye,

>If i download the software, can I just unzip it to the disk?

Yes, provided you have an unzipper program.

>Does atari also support a unique filesystem (aka not DOS's FAT16)

For floppies, it's the same as DOS. The disks boot sector is slightly
different, which can cause trouble in some cases.

>What is a store expansion?

No idea. I think he meant a RAM upgrade.

>Why should I get a mono monitor when I already have a color one?

Because some programs will only run on a mono screen and games will only run
on a TV/colour screen. If you are into serious computing, you NEED a mono
screen for hi-res.

>What are MagiC and MiNT, and does MiNT run TOS applications?

They are both multitasking OS's that both run TOS and GEM apps. MagiC is
commercial, easy to install. MiNT is free, unix-like, and more complicated
to install.

>Should I get a new version of TOS, and is it easy to upgrade?

It depends. Get a HD first, then some RAM, start messing around and see if
it's ok for you. If the TOS is 1.0, then an upgrade would be quite
beneficial. If it's 1.04, you can wait a while.

Do you think computers were invented last year ? Of course an ST with a 68K
at 8MHz is much slower than a PII 400MHz, but it does the job just the same.
Do you think you really need a PII just for word processing ?

First of all, Linux is not an option on a 1Mb 68K machine like the ST. If
you want to run Linux, you really need at least a Falcon or TT.

There you said it all. With MagiC no probs but with all the rest just a
bunch of probs. Try to run Jinnee with Geneva for instance. AFAIK, it
won't work. To use Jinnee under MiNT/N.AES you *must* use wdialog
otherwise it won't work. The same goes for Cops. It need *wdialog*
otherwise it refuse to start.

As far as I am aware there is only *one* editor of Atari Computing...
Joe Connor... and he uses MagiC, MagiCMac, MagiCPC and TOS. Editing a
mag is hard work and he really does not get enough time to play around
with different OSs anymore.

Thank him for doing such a great job in a small market.

Why would anyone praise me?

>Listen, I really appreciate what those people do, but facts are fact:

But why appreciate me? I don't do much, do I? I can understand the
appreciation for Joe and Tony though, among many others...

>Joe Connor _is_ known to procrastinate cashing in shareware registrations
>(he _is_ a busy man, but it doesn't excuse the longish delays people
>constantly report) and (with his TransAction mates) in translating some
>shareware people anxiously await.

I can't speak for Joe, but I do admit defending him in newsgroups when
I see something criticising him. Wanna know why? Well here goes...

Joe and I go back a long time - in fact it was Joe and his shareware
work that inspired me to start up my own shareware scheme as
CyberSTrider - even though I had never met the guy and we both lived
around 250 miles apart.

As a shareware registration service, I totally understand the
'problems' that Joe faces as I face the same. Lack of time being the
biggest factor. We both have our own families that we need to spend
time with - Joe had children too that he needs to look after.

I have a full time job in addition to CyberSTrider. Shareware takes
time - especially when people order master disks with the
registration. Each master disk can take up to 20 minutes to do -
customise the disk for the registree, stick a label on the disk, print
out the letter, seal the envelope... enter details in database,

allocate the money to the correct author account.Many things need to be donefor each registration.

The amount of time spent does not reflect the amount of money kept from each registration - which boils down to next to nothing.

Joe looks after Atari Computing - a full time job in itself. CyberSTrider has varied interests which make him money... much more than shareware ever did, can and will.

Additionally as Joe does not trawl the newsgroups, I tend to 'speak' on his behalf to keep hisname in the correct light.

As you can see the only reason I do this is because I understand many of the things as they are similar to my situation. Without offending anyone here, I'd just like to say that until you actually run a registration service yourself you will not know about the problems that you will come across. Ask me today if I would start up a registration service and my answer will be a definite 'NO'. It was fun to begin with - I had the time - it gave me some fame... but it was not worth the time I put in from a financial viewpoint. Why do I continue with it? Simply because I owe it to the Atari community.

>Tony Greenwood _does_ have a peculiar attitude towards those that don't
>share his views (even though his coding speaks for itself: that guy
>_does_ know about atari programming).

I don;t share his views but do get on with him. ;) In fact, he looks after my subsidiary company at web.cyberstrider.net

>Dinesh Bahbuta _is_ known to defend either ones feverishly, even when
>others' statements are obviously true and well-justified.

Not necessarily justified.. i will only comment (I don't always) when I know the background to the issue better than the poster does - and believe me - I do speak with Tony and Joe quite often and would be in a much better position to tell people the truth than a poster who is complaining about the situation.

>I must say that I NONETHELESS ADMIRE ALL 3 FOR THEIR CONTRIBUTIONS,
>especially Joe for trying to juggle Atari Computing, Interactive and
>a rather demaning family life, simultaneously. Joe, where can I buy
>a planner like yours? ;-)

;) I wish I knew tooo.. he doesn;t tell me...

>Every time I read Atari Computing, I cannot help but notice that _all_
>screenshots are from Magic, nor can I miss the "I am a MagicMac user"
>vibe that has transpired since day 1, nor have I seen much of any MiNT
>content ever.

I must admit I am a MagiC person and this is mainly because I no longer have the time to fiddle with MiNT, MultiTOS and the other OSs such as 'SMS' like I used to at one time. MagiC for me helps because I

can use the same applications on the ST, Falcon, and my PC.

That said, IIRC, one of my screenshots of the Freedom File Selector in one of the AC issues was taken under MultiTOS... :)

I do believe in other OSs featuring in the mag, but if contributors do not offer anything else and readers do not ask for anything else then AC can not do anything. Contributions are accepted by anyone who can write. If someone cancontribute a series of articles on MiNT then all the better - I am sure Joe will put them in the mag. I used to play around with MiNT (heck I maintained the MiNT ftp archive at HENSA) quite a lot in the old days but then I had the time to. It;s the sameat work.. I will not install anything new (apart from updates) in the offchance that I may crash the system and have toreinstall everything from scratch.

Anyway, enough from me - I hope you guys and gals can see where I am coming from...

Regards
Danny

The michigan Atari ftp site has moved. If I type in atari.archive.umich.edu it cannot be resolved. If I type in 141.211.120.11 it can be resolved and in the log file of NEWsie it states that the archives have moved to archive.umich.edu however I am getting no connection.

Can someone try this with NEWsie and or provide the corresponding numbers for this site.

Thanks Brian.

I was going to upload some more modern apps found elsewhere.

2428. Umich ftp/http

Source record: 84815

Yes, I know I can http there should anyone offer this advice.
However it is slower than NEWsie and ftp. It always makes a second copy
in the Cache of Cab that takes up more harddrive space than necessary when
downloading. And I don't think you can upload via http://?

later
Brian.

You are getting the dial-up connection but it sounds as though the
log-on (or PAP exchange) is not working properly. I bet you don't get
an IP reported in the Dialer Dialogue.

Check the DIAL SCRIPT in DIAL.SCR you should have something like:

```
#
# Dial Script
#
FIND_TIMEOUT = 50
#
DIAL_SCRIPT
#
WAIT =
REPT =
FIND = login
RESP = ZETppp
#

Sorry, Linux requires store-access interrupt handling which is not
available in the 68000 processor. You need the 68030 (Falcon, TT etc.)
to be able to install this. Just as any PC before the 386 will not run
Linux.

What do you use as server software on Cyberstrider.com?

If you answer Linux, then I really think you have no excuse for not
keeping up with MiNT developemnt.

If you answer NT-Server, well..... No comment...

> I do believe in other OSs featuring in the mag, but if contributors do

True. Anyways, keep your eyes peeled for my upcoming MiNT distribution.
When it's ready, I'll write a little something about it to introduce it
in AC...

After installing Spin 0.34 I get the most rediculous directory's
after opening drive A: . One time its a mess the other you see a part
of another for instance C or D: etc. I use MagiC and TT030
CD ROM drive works fine. Forcemed.app (mediachange): no results.
Config:
C:\auto\config.sys
C:\auto\metaxbs.prg
C:\gemsys\magic\xtension\spinmagc.xsf

Anyone any ideas?
Thanks in advance Bram

Yah, this guy also did:

Atari 8 bit:

A graphic drum synthisizer called "The Rythymizer" published by "ReeveSoft"
Heck, that program even had DIGITIZED frames of animation of himself that
played along with every beat! (This was funny as hell to look at by the way..)

Munsiepede 1 and 2: Really cool centipede clones on the 8 bit!!

An 8-bit graphic desktop publishing program (better than ANYTHING ever
released on the 8 bits..) killer that Antic was going to publish and then the
magazine went out of buisiness.

On the ST:

GP Shoot
GP Race
MS Pac
Bobble!
Evader
Kid GP
Asteroidia
Frantick
Square Off
Bugs!
Seawolf
Dark Pearl
PC1quence
ST Doodle
Kid Kong
Bezerk
ST Invaders
Deluxe Invaders
Kaboom!
A few other tid bits that may be floating around...

Plus, he had the BEST EVER Choplifter clone/upgrade game 85% finished when he
realized his wife needed something called "money" to feed their 3 kids. Lucky

enough, he was able to find a job that gave him lots and lots of these small green things for his limited talents, enough to feed the kids once again.

I understand he still has all of his source code, to his games, stuck on a mega STe hard drive. Just sitting there....

You'll have to look for a second-hand Falcon, I've seen them
advertised regularely in this and other Atari newsgroups.

A standard Falcon will set you back somewhere between USD150 and 200,
if it has a lot of extra stuff then expect to pay more.

> Joe Connor... and he uses MagiC, MagiCMac, MagiCPC and TOS. Editing a
> mag is hard work and he really does not get enough time to play around
> with different OSs anymore.

Danny is correct. Joe is the only editor of the mag. and does use the various OS's described as well as whatever came with the Milan he now uses too.

Personally, I use Magic or Magic_PC 99% most of the time now. There is only one program that I use that won't work with it, so I revert to TOS for that (Funnily enough the Genealogy program that I initially bought an Atari for). I used to use Geneva/Neodesk, but I switched some time ago. I did get Mint when I bought my Falcon, but at that time I was already using Neo/Geneva and installed that instead.

Why don't I experiment with other OS's?
Like most of the people here I have been using Atari's for many years now. My use of them has matured to the extent that I rarely experiment any more. I am happy with the word processor, database, spreadsheet and comms programs I have. I can't afford either the time to learn much new software, or to risk new software or OS's screwing up what I have. My system is stable and reliable and that's how I personally want it to stay.

I can totally understand each individuals enthusiasm for their own choice of OS and would never attempt to change anyones mind on this. At the end of the day, we're all part of the same community.

Is there a bias toward Magic in Atari Computing?
No, certainly not a conscious one. Mike has already explained about the reason for the apparent disproportionate use of Magic screen shots so there is no point in me repeating that.

Is there a place for articles on ALL available OS's in Atari Computing?
Yes, of course there is. But the people who are principally involved in the magazines production (Joe, Mike, Brian and me) use what we use. Although there may have been very little on Mint (for example) there have been no cynicisms either. If we don't use it we can't write about it.

How can you get articles into the magazine?
Mike's point about someone who is familiar with Mint writing something for the magazine is valid.

If there is anyone here who would like to consider doing so, then please email me privately with your thoughts, and we can discuss the best way forward.

This applies to ANY OS or software. The magazine is written, edited and published "by enthusiasts for enthusiasts".

If you are an enthusiast please feel free to contribute.

We are ALL part of the Atari community. We don't all need to think the same, or like the same software and OS's, we're all on the same train even although some of us are in different carriages ;-)

> I'd mostly be using it for games, sound, and web browsing. Would the TT or
> Falcon be cheaper? And which costs more?

It sounds like the Falcon is what you need. You really need
colour-graphics for web-browsing (the Falcon will display 65K colours
on your colour-monitor), and if you want to use it for sampling/D2D
and not just MIDI then it's also the only choice for sound-apps.
Softjee has made a lot of really excellent sound-software for the
Falcon, this is easily the most cost-effective sound-machine you can
get today.

There's not that many games available for the Falcon, but with a bit
of trickery you can run most older ST-games. The same applies to the
TT, although the TT is slightly more compatible with games. It's
useless for sound though.

The TT is a nice machine (I have one), but without a graphics-card it
will only display 16 colours. It has the same sound as the STE, i.e.
not usable for a musician. It's twice as fast as the Falcon, has a
separate keyboard and is extremely solid and reliable, but it's also
more expensive.

I don't mind to stick some system-extensions in my autofolder to get
certain stuff working (and generally save a lot of memory, since
otherwise every ASH-app would be linked with wdialog...), the *real*
problem here is that WDialog simply doesn't work.

There's probably several reasons for this, some of them might be...

1. wdialog is a low-priority project, since they really doesn't bother
with non-MagiC users.
2. it's a part of the "ASH-conspiracy" (1) in getting as many
MagiC-users as possible ("It works flawlessy under MagiC, it's your
shitty OS that's the problem.")

(1) See the thread "MiNT superior?"

But Wdialog is meant for non-MagiC users. isnt it?

> 2. it's a part of the "ASH-conspiracy" (1) in getting as many
> MagiC-users as possible ("It works flawlessy under MagiC, it's your

I think problems arise when you use Wdialog with Magic to overcomemismatches of older Magic version with newer ASH programs.
This problem can not easy be solved.
Of course it is annoying that you have to (expensively) update your Magic for those newer programs. May be it is time for ASH to give the newest version of Magic for free if you buy one of there products that need this.

From: es@apollo.lv
Message-ID: <36bc95e4.0@news.rig.tkom.lv>
Source record: 84833

I use MagicMac. Maybe that sounds bad for MinT users, but on my 68030 Mac it is the only and best possibility to get decent speed and good compatibility with Windows users. (I must exchange formatted text files). I can use Windows fonts (with NVDI) and only need to save from Papyrus as RTF file. No conversion needed.
From Mac, it is much more complex to exchange files with PC. Of course, there is the third possibility - get a PC...
I have come to Atari (sorry, to MagicMac) from Macintosh. I like Atari applications, they are useful to me.
As you see, Magic also works for Atari, not only against (?) it (as I gathered from some posts in this NG).

Just my two cents...

Btw, is it possible to change desktop icons's titles with Magic/Magxdesk
so that they are not equal to file-names. With alternative desktop (i.e.
jinnee) it is obvious how to do it, but somehow I could not with Magxdesk.
And of course, all my documentation is in german...

>
>Please, could you contact me for further help ?
>

I have heard some rumours that GAL burners are actually very simple
interfaces consisting of very few components beside a power supply
and a cable to connect the thing to a computer. Does anybody have
more information on that?

Cu.

Hi Gordy
I've already got your dial.scr and default.cfg thats how I got started
in the first place, thanks. I'm using Sting v01.12
I'm pretty sure I am connecting to the net as I get link established and
an IP address appear.
One thing I'm not sure of, if I'm just running TOS 2.06, no
multi-tasking stuff, do I need to run the Dialer.app as an accessory ?
I've got another STE at work so I'll try Sting on that Monday, then at
least I'll know if its something I'm doing wrong.
Cheers
John
PS. Hows the ST Plus Fanzine going ? was it you and Rich I met at ACC98,
I was selling the ST software with the christmas lights round the table
....

I don't believe TOS 1.4 would even fit a STe. STe's came with TOS 1.6
or 1.62 stock, then could be upgraded to TOS 2.05/.06

2453. FS: Toadfile Dual Bay Under The Monitor Hard Drive Case $45

Newsgroup: comp.sys.atari.st
Date: 1999-02-06 00:00:00 UTC
From: tj@oro.net
Message-ID: <tj-0602991753390001@gv1-240.oro.net>

I have some original Atari brand at $4.95 each, a Wico Command Control for $10, and an Epyx (contours to your hand) XJ for $10. Prices above plus postage. All in great shape.

2456. FS (USA): Multisync monitor - $45 (LAST CALL!)

Newsgroup: comp.sys.atari.st
Date: 1999-02-06 00:00:00 UTC
From: LONNIEMCCLURE@prodigy.net
Message-ID: <MPG.1126d42647b977e7989688@news.prodigy.net>
Source record: 84843

I still have the AT&T 329-M (rebadged NEC Multisync II) for sale, now lowered to $45 + shipping.

If it does not sell within the next week or so at this price, I will be posting it to an auction site, so if you want it, act soon.

For use with a Falcon030, you will need the VGA monitor adapter block (a HDB-15 to DB-9 cable is included with the monitor, along with the power cord and a DB-9 to DB-9 cable).

While the included HDB-15 cable will work directly with a TT, I know the TT sync is a little nonstandard, so there might be a problem with the width of the display, similar to the problem experienced with some standard VGA monitors.

For ST use, you will need to make your own cable.

For pinouts on the DB-9 port on the back of the monitor, see:
http://lwp.ualg.pt/docs/hwb/co_VGA9.html

For more info on the monitor, including answers to most questions you might ask, and pics of the monitor, see:
http://members.delphi.com/lmcclure/sale/index.html

What type of RAM upgrade is it? ISTR that the S-DMA couldn't read from
some RAM upgrades - maybe thats the problem (or maybe not), however
it sounds like you've just replaced the 4Mb SIMM with an 16Mb one, which
means its unlikely that its this...

>Sorry for the long overdue reply, but you know how hectic life gets ;)

Same here :)

>Cyberstrider (especially the web hosting part) is doing a _lot_
>for the Atari community! ;-)

And will continue to do so - I have a few other things I am planning
on doing so keep your eyes peeled.

>Trivia:
>why do so many ex-Atari users become webmasters or tech support,
>yet refuse to have anything do to with MiNT or any other Unices
>on their Atari.....

1) I am not a full blown webmaster - I dabble here and there and
update my own pages. However I use other people to design sites for me
and do coding... I just do not have the time.

2) Which atariands do you know have gone in to tech support - must say
I haven't gone in to that. I work for a large ISP as a Hostmaster.
Since first using the Internet in 1989 I have always believed in its
usefulness and all my jobs so far (since graduating) have been in the
internet industry. In fact I used the Internet before I had my first
Atari!

>Answer:
>beats me!

My comments here are not in response to what I think is flaming. For
the record I am trying to convey where I stand in all of this. :)

I can't comment on that but I have been a Unix user before being an
atari user. I have not neglected MiNT - I just do not have the time to
dabble in MiNT anymore. Unix I use at work and I can dabble there. I
do not have access to Ataris at work so dabbling in MiNT is out of the
question. Once I get home - which tends to be quite late - the last
thing on my mind is tackling MiNT - I have my wife to spend time with
and CyberSTrider business to take care of. If I had the time I would -
but I don't - even messing around with different software is out of
the question - I have a set number of things to do which I do and
that's it. So much so that if a computer of mine needs upgrading - I
don't mess around with upgrading the components - I just go and buy a
new one.

>(bit about the pros and cons of running aregistration service)
>> Additionally as Joe does not trawl the newsgroups, I tend to 'speak'
>> on his behalf to keep hisname in the correct light.
>Exeperience has proven to me that speaking on others behalf is lethal,
>but well.... you're a grown man, aren't you? ;-)

Yes and as I speak to him very often and know the problems both of us face, would you not agree that I am more qualified to 'speak' on his behalf than someone who doesn't know about those things?

>What do you use as server software on Cyberstrider.com?

Unfortunately I do not hold Cyberstrider.com - some wicked person registered it and I guess are waiting for me to approach them to buy it from them for thousands of pounds...

As for cyberstrider.org and cyberstrider.net - the server runs under a variant of Unix. The server is owned by a friend of mine as he has the Leased line - so he spends all the time upgrading the Unix and various compnents of the server. I am a super-user of the system and can and do install software that is useful for the running of CyberSTrider.

>If you answer Linux, then I really think you have no excuse for not
>keeping up with MiNT developemnt.

See my comments above. :)

Do tell me though - and I ask this for educational purposes - can a Falcon/ST running MiNT run as an Internet services server in much the same way that the cyberstrider server does? The amount of memory, ethernet, disk space, speed? If so, and if I can do this without spending too much time setting it all up, I would be more than happy to place a set up done by you at the end of a Leased Line for testing purposes. Remember - this has to be all in one single unit, about the same size as a 19" rack unit as space is a premium.

>If you answer NT-Server, well..... No comment...

I use that too...

>True. Anyways, keep your eyes peeled for my upcoming MiNT distribution.
>When it's ready, I'll write a little something about it to introduce it
>in AC...

Excellent! This would be very good and I do look forward to your distribution kit.. will this be a bit like the MDK from a few years ago? I would also be happy to read about it in AC.

Regards
Danny

Katherine asked on 3 Feb 1999;

>Please, oh please, tell me how you convert a JPG into a 16 col grayscale
>GIF scaled down with a factor of 1/4th with IMAGECOPY.
>I am very curious.
>If you tell me how to do that with your "commercial" software (which btw
>is a very good viewer), I will apologize.

Lets keep things in perspective please, when I wrote I like ImageCopy better to convert JPEG into *.* I wasn't talking about scaling down, or converting them to grayscale.
If I needed to that I would use another "commercial" program-) eg: Photoline; with this one I'll load the JPEG faster then any other prog can do, convert to whatever grayscale level I like, while also taking care of brilliance and contrast which always needs to be adjusted on a grayscale picture.
As I said before: I use the tools I need to get a certain task done, be it Imagecopy, Photoline or even Jpegem, as long as the task gets done, I'm a happy user. What I don't like is to have to use two or even more apps to achieve the same result.
Using Your example I would still need to touch up the pics with a filtering tool, because the pics are just to dark and the contrast to high. Still, once more I learned something thanks to this newsgroup: I didn't realise it was possible to do more then just a simpe plain picture convert with JPEGEM. I now took the time to read the docs, convert some pics & fiddle a bit.

Not a bad program at all Katherine, nice piece of work, Keep it up....

Cheers from Belgium

Dennis

Katherine wrote on 04 Feb 1999:

>Latest one in date, micq 0.3.4 (latest btw) And mpg123.
>Of course, I take it, you guys don't want to play mp3 files. Nor have icq
>pager. right?

Sorry guys, but this one is to good to resist -))

If I understand this allright, You play MP3 files under Mint on a Falcon??.
Well, this is really something !! People using 68040's be it Atari clones or
Macs can't do this. Oh boy, how I wish I could hear those MP3 files play...

On my humble TT with Cattamarran andNova Card installed, I manage to sqeeze
7 sometimes 8 frames per second out of a MPEG, which is comparable to sloooow
motion. I really will have to install Mint, right ? With Mint installed I'm
gonna be able to view MPEG at full speed and even sing along with my favorite
MP3 files....

Can anyone please explain me how this is done ?? because once again it looks as
I don't know nothing here?? Explain please.....

Katherine, I already know You have some sort of "special" Falcon. Now, I just had
a idea: could it be that a computer takes over some features of his/her user ? I'm
thinking in lines here like : user doesn't like a certain OS, so computer refuses
to run it; user happy... (and vice versa)
I'm eagerly waiting the next announcement; something like " hey guys with Mint
installed my computer talks, makes jambutties and does the washing !!! "

Serious now: I agree with You when you told me that I was shortsighted and didn't
really know what kind of apps are ported to Mint. But it's time now You admit that
these ported apps are not usable on the atariplatform, maybe a HADES060 could
manage it, but except for that one ?
So here come the next question: why waste all that precious time porting and
converting a certain app, when knowing it will run but be unusable ? What guy is
doing this ? why?

Cheers from Belgium

Dennis

PS: I use a simple CD Player to listen to music, instead of MP3
I use a simple VCR to view films, instead of MPEG

Martin asked on 04 Feb 1999:

>Can you explain me how you managed to get a fast print with the powerprint
>and Calamus SL? So far I didn't succeeded to make Calamus print at an
>usable speed. Right now it takes some 3 minutes to print out in 600 dpi
>one single text-only doc (150 kB) on a HP laser jet 5 (pc model).
>Needless to say that's useless.

Martin,

I suggest You have another look at the various settings, because (I've just
checked this) with a Performa 630 to print out a doc from Calamus at 600dpi
on a HP 4 takes a little bit more then 1 minute (1' 08"). The doc was only
110Kb big but I can't imagine that those 40Kb make the difference.
I think Calamus is to blame here, because a 58 pages (350K) document containing
pics, Calamus and TTF fonts is printed in about 25 minutes (2 pages a minute)
with Tempus Word Pro...

Cheers from You know where

True, but I was talking about the 85% "other" users, not the Power Users or
people already connected to the net.
These people are unaware about what is possible with their atari, just a month
ago a guy a know bought himself a PC because he needed email for his business.
When I told him this was perfectly possible on a Atari, he just smiled.... in the
PC-store they told him he needed at least a Pentium to be able to do that.
We, are well informed, thanks to usenet, but a lot of people have always depended
on the various magazines to get the info. Since these are nearly all gone, the
source they've depended on is gone. So they keep using their machines and their
software until the day comes they need to do a certain task which they think is
not possible with the atari, and they switch.....

>The major commercial market for Atari-machines and software is Germany, and
>the majority of the "power-users" (i.e. people that actually cares about
>multitasking, upgrades etc) are either on the internet or mausnet. Have a
>look at the maus-groups and you'll see a completely different world than
>these UK/US dominated newsgroups.

Once again, these are the "power users", the average German Atari user is not a
member of the maus groups. The average German user is just as ignorant as his
American, British, Belgian, *.* counterpart. In germany their is one atarimagazine
left which apart from bookstores in railwaystations from big cities is not widely
available. Take a look at http://www.atari-computer.com/bbs/ to see some of the
questions the average German user asks, You'll be amazed....Questions like those
aren't even asked in this newsgroup.
I'm not saying we are the "elite", but sometimes we tend to forget that a lot of
atariusers are still on a 1040 with a Megafile 30 connected, the last readers survey
from the German ST-Magazine is also worth looking at.... Nearly 20% didn't even have
a harddisk, 15% used a portable TV..... Only 20% could be called "power users" and
that last group forms the people we have contacts with.

So I'll say it once again : "Welcome to the real world"

PS: It's very misty tonight, no flying pigs in sight...

Cheers from Belgium,

Dennis

I'm fairly sure version 4.? is the latest. Supposed to be faster (it
takes some extra power from the ADB port) and supports more printers
(and there's now a USB version for iMac and the new G3).

I m glad someone is making some use of them.....:-)

I am using v01.15 and using my scripts here with no problems at all.

>I'm pretty sure I am connecting to the net as I get link established and
>an IP address appear.

You are getting connected to the internet ok or you would not get an
IP address.

>One thing I'm not sure of, if I'm just running TOS 2.06, no
>multi-tasking stuff, do I need to run the Dialer.app as an accessory ?

Its possible.Does the modem diconnect while STing is still in memory?

In singleTos when running STing as an app you would have to quit
STing then load in your internet client.Do this test,connect to
freeserve and leave STing in memory for about a minute and see if it
disconnets the modem.If it does not run disconnect the dialer as an
accessory.

worth a check.Are you using Xcontrol or Cops as your control panel?
If so check that you have the cpx's that came with Sting installed.

>PS. Hows the ST Plus Fanzine going ? was it you and Rich I met at ACC98,
>I was selling the ST software with the christmas lights round the table

No,I have nothing to do with ST Plus....I think you must have me
confused with someone else.....

Any more help just ask..

Its not possible to change the icon name so they are not the same as
the program name.Thats with the desktop supplied with MagiC 5.Not too
sure if there is any difference in MagiC 6.

>Can anyone help me out here.
>AFAIK there are at least four UTSI sites at the moment, all maintained by
>different people. Will the real UTSI stand up please...
>I'm getting confused here
>
>
Actualy there are three version of the UTSI

1) The original UTSI hosted by Jo Vandeweghe. It's still available but for
the moment it isn't maintained.
http://ping4.ping.be/dipching-drulkhor/INDEX.HTM

2) The UTSI pages maintained by me. When Jo decided to leave the Net he
has given me _and only me_ the permission to hold and maintain the pages
http://www.ping.be/~ping1030/atari/prg-ind.htm
As I've found that lots of links doesn't work anymore I decided to put
a ftp-link also. At the moment I only use the Belgian ftp-site but this
may be change in the future.

3) UTSI page maintained by Yann Lossouarn. This French guy maintain also a
UTSI version but he never got the permission of Jo to do so.
http://utsi.atari.org

So officialy I'm the real UTSI.

However Yann and I are working together. Yann will hold a frame version of
UTSI whereas I only hold a non-frame version. Both version has a link to
each other.

Any comments about the pages are very welcome.

> Falcon be cheaper? And which costs more?

For games you might be best keeping the ST as you then won't have to fiddle with anything to get them to work. You can get some to run on a Falcon or TT, likewise on the Pacifist PC emulator (I'm told), but as you have the correct machine anyway you might as well keep it.

As for Falcon vs TT prices, my *hunch* would be that a Falcon might be a little cheaper, but I suspect that prices on both will depend on what's been done to them in terms of upgrades.

If you want to just have one Atari machine I would agree with Jo Even that a Falcon sounds like what you need.

Yes, I agree. I don't think it is bad to have strong beliefs (I do myself),
as long as respect for other opinions is present as well. I find it just as
important to listen to what other people say/think as I find it to share them
my opinions.

If peoples opinions were always treated with respect (that is not always the
case), I believe nobody would take anything personally here. Maybe not
everyone agrees on that one, but that is what I think.

Regards,

Joakim

Yep I can use it.
Initialy I got the same prob but the secret is the right setup:-))

So here we go:

Go to "Optionen/bibliotheken" menu.
In "Bibliothekseinstellungen" you must fill in under
"ordner der Bibliothek" the path to the bib

e.g. H:\ARTHDEM\LIBRARYS\ENGLISH\

And now the BIG secret: In Maske der Bibl.-Dateien use '*'

That's it.

Have pleasure with.

For files with the extension ".tgz" you must first launch *gzip*

As parameter use "-d". For instance, to unpack this: my_file.tgz use this
in the parameter box: "-d my_file.tgz"
This command will unpack the archive into my_file.tar

Now to untar this file you need *tar*

Use as command this "-x". e.g "-x my_file.tar"

The "-x" is in the most case enough. Sometimes however you'll need a more
complex command. For a list of possiblities use "-?" as command when you
launch *tar*

The latest *gzip* and *tar* can you find at the homepage of Mille Babic or
at the usual ftp-sites.

http://user.tninet.se/~gcc561r/archivers/gzip.html
http://user.tninet.se/~gcc561r/archivers/tar.html

Hope this help

>C:\gemsys\magic\xtension\spinmagc.xsf

Rename metaxbs.prg to metaxbs.prx
and add:

SPIN_SD.BOS
ISO9660F.DOS

to your auto folder.

If you use HDDriver then switch on the Generic device driver in the
"Advanced" menu, otherwise install SCSDRIV.PRG (rename with a prx extension)
in your auto folder.

Most of these points are in the docs!

Come to Norway and visit me, I'll be more than happy to let you listen
to mp3's on my Falcon.

IMHO you're full of crap. Please come up with one (1, just one)
"ported app" that's not usable on my Falcon. Just one, and I'll keep
my mouth shut.

Hi John,

I tried to connect to FreeNet (I know you are trying FreeServe)
for a couple of months but gave up and joined ZetNet in the end.
If only to save my sanity.

I had the same problem with COPS which I found to be a bit unstable
anyway so I reverted to the normal CPX control panel.

Also, I had to put the STING.INF in the C: root as it didn't
work in the AUTO folder as described in the docs.

I am now using Sting 1.15 which has I found reports problems that were
missed by the earlier version (1.0?) that I had been using.

If you have any luck with FreeServe then you will let us know won't you ;-)

I must agree, you can't always guarantee that the country (if any) used
in the address is relevant anyway.

You don't have to be specific like my signature, something like UK, USA,
Canada etc.. even Europe would do.

I've seen adverts in the UK only newsgroups that aren't in the UK! You
really can't tell unless being told.

>Double sided double density (DSDD) 3.5" disks. 720K

Use double density disks if you have a double density drive, this is the
disk that has one hole with a little slidey thing to cover it; this is
the write protection thingy;) The high density disks have an additional
hole.

Most Atari drives I've come across cannot be trusted using high density
disks. If they can be read one minute and not the next, then you know
that you data security is not going to be secured.

None of my ST's fitted with a standard DD drive cannot read HD disks
without difficulty, they seem to write to them and format them OK. I
have to use an external drive with a larger (I can't remember the word,
it's not as sensitive or something like that.

Strangely my ST's high density drive can't read high density disks
written by an Atari!!!!!

>
>> B - where I can get said disks

I am hoping to find a supplier for the disks, in the very near future. I
used to use ex-software disks, but the supplier I got them from no
longer exists.

If anyone knows of one please let me know.
>
>Some shops still carry them. If you can't find any, just get some HD disks

Why tape over the HD hole???? I wasn't aware that the switch that senses
the HD disks are there in DD drives!

No I don't believe it is. I am using NEWsie.94 with TOS 1.0 after .92 failed to close windows for me at all:-). Comparing .86 with .94 it is just the same. Perhaps time to optimise you hd.

I am having one problem though with .94 and this is when you delete the article after reading my harddrive fails to engage acting like it is disconnected and sending the error message, check connections.. then returns me to the index where I can delete the information perfectly hitting delete and closing window. This doesn't occur with any previous version NEWsie or when running NEWsie with Magic.

I am using TOS 1.0 520ST with SH204.

Anyways, I am not finding it anyslower. I don't find it slow.

2506. MOUSE-1040ST-fm

Newsgroup: comp.sys.atari.st
Date: 1999-02-07 00:00:00 UTC
From: "Andy Laity (USA)" <LAITY@prodigy.net>
Message-ID: <36BDD24C.7183DECB@prodigy.net>
Source record: 84693

I just dragged my Atari 1040ST out of the attic. It appears that the mouse no longer works. The cursor moves around the screen, but the mouse buttons don't work.

Is it possible to purchase a new mouse for an Atari ST? Also, is it possible to "bypass" the mouse and use the keyboard to enter commands?

I admit to not knowing much about this computer. I'm just trying to see if it works so I can try selling it. It boots up to GEM but I can go no further without a working mouse. Or can I?

The Atari ST seems to have a loyal following. Perhaps someone can actually use this machine (I never did!).

Andy

mail.zetnet.co.uk in both places.

Have you tried this over a long period ? Zetnet have a habit of automatically locking mailboxes if anyone (including yourself) tries to contact the box while it is already in use. This takes anything up to two or more hours to unlock (also automatically - tech support can't do it for you).

You will get the error message "Password not recognised" while the box is locked.

Also, have you ticked "Use saved password" in the mail reading options, as well as putting your password in there ?

HTH

Cheers

Paul

Maybe you should have. Read on.

> If I understand this allright, You play MP3 files under Mint on a Falcon??.
> Well, this is really something !! People using 68040's be it Atari clones or
> Macs can't do this. Oh boy, how I wish I could hear those MP3 files play...

Dude, doing it on purpose.
The thread here is about OS.
That means that if you have slow hardware, oh well, don't expect what's
not realizable.
As in, a Hade 68060 at whatever power WITH magic can NOT play mpg3.
Same goes for AB40 etc etc. the OS here is the limit.

While with MiNT only the hardware is the limit.
So, evidently, a 520st or a 16mhz falcon no matter the OS can not
physically play mp3 in real time.
I guess it must be frustrating to have a 060 hades capable of playing mp3
in real time no problem. But the OS (magic) won't allow it.

> So here come the next question: why waste all that precious time porting and
> converting a certain app, when knowing it will run but be unusable ? What guy is
> doing this ? why?
1) because some people do have high spec machines.
2) some people don't mind waiting hours (letting the computer all night
doing conversions)
3) because it is possible to do so. and optimizing is always a
possibility for slower machines.

4) back to you. Why working on CAB with a 1040ST color monitor or even
mono? Do you consider this usable speedwise? Some people don't mind, they
just wait for the page to format, display etc. And it looks crappy. At
least it is possible. right? Should CAB be limited at >68040 ?

> PS: I use a simple CD Player to listen to music, instead of MP3
> I use a simple VCR to view films, instead of MPEG
I do too. Cheaper so far for me considering my collection of movies and

audio cd. As opposed to $/MegaBytes of a harddrive which is more precious to me than having a 8 meg animation.

However, there is one point of mp3 or mp2 you missed. I recorded my latest demo (personal), Do I send you a 45meg WAV file through email for you to tell me what you think?

what?
Only java, emacs and mp3 are too heavy to run well on slower machines.
You don't need a 100mhz machine to run all the other ported software.
A 16mhz machine will do fine.

I hope you understand a little german.
Greetings,
Thomas Warnemuende.

HERE it is:

Probleme mit dem Sound-Subsystem des Atari F030

Autor: Robert Schaffner

Robert Schaffner
Am Sch�ferpfad 10
63303 Dreieich

EMail: Robert Schaffner@OF2.maus.de Tel/Fax/Modem: 06103/67197
(MausNet)

Rev 1.3

SoundIN-Teil F030 - Platinenrevision B/C

Zu Bemerken w�re gleich am Anfang das mir dieser Fehler bis jetzt erst an
zwei Falcons der Revision A und B aufgefallen ist. Diese Textdatei kann im
allgemeinen nicht auf jeden F030 angewendet werden.
Zumal es schon alleine nur im Soundsubsystemeingang schon zwei verschiedene
Sound_In Beschaltungen und auch zwei verschiedene Schaltpl�ne gibt.

In jeden Fall sollte man bei Knack- und Kratzger�uschen w�hren dem Sampeln,
dem Abspielen einer CD ect. zuerst sein Augenmerk auf die Klinkenbuchse werfen.
Ein leichtes Nachbiegen der Kontaktfedern kann hier schon wahre Wunder ausl�sen.
Und hat meistens auch schon Erfolg ohne das man den Rechner mit
nachfolgendem Garatieverlust �ffnen mu�. Ein gewisse Vorsicht sollte
man hier troz allem walten lassen. Meistens liegt es nicht mal an der
Miniklinkenbuchse, sondern eher an den Steckern die offensichtlich
gr�ssere Unterschiede in den l�ngen und der Stiftst�rke aufweisen.

Bei den beiden Eingangs erw�hnten F030-Computern hatten die Soundst�rungen
jedoch zwei ganz unterschiedliche Ursachen, die jedoch am Anfang der Fehlersuche
die gleichen Symptome aufzeigten.

Bemerkenswert erscheint mir die Tatsache das selbst ein Versuchsweises �ffnen
eines F030 die Garantie erl�schen l�sst, also erst Nachdenken ob man wegen
diesem Fehler die Garantie verfallen l�sst oder eben seinen H�ndler daf�r
konsultiert, sofern man ja noch die Garantie hat.

Nach dem man im Falcon die oberen Abschirmbleche entfernt hat kann man bereits alle Komponenten eines F030 in Augenschein nehmen.
Zum besseren Handling ist es aber sicherer wenn man die Bleche komplett entfernt. Dazu mu&#65533; leider auch das Diskettenlaufwerk gel&#65533;st werden. Hier ist das Flachbandkabel recht vorsichtig zu bewegen!
Nur so erh&#65533;lt man vollen Zugang auf die Platinenstelle die das Soundsubsystem tr&#65533;gt.

Auch ist es gut, wenn man bei dieser Aktion den Lautsprecher vorsichtig absteckt, er hat recht kurze Anschlusskabel und ist jetzt nur hinderlich.
Zu ersten Messungen und Tests gen&#65533;gt es allerdings wenn das obere Abschirmblech und das Floppylaufwerk entfernt wird. Das Floppylaufwerk besitzt auf der Unterseite des Rechners drei lange Schrauben, die vierte Befestigung ist ein Abstandsbolzen aus Messing der gleichzeitig zur Zentrierung und zur &#65533;bertragung der Rechnermasse zum Laufwerkt fungiert.
Ebenso so mu&#65533; bei einem kompletten Ausbau der Hauptplatine das Schaltnetzteil und die interne 2.5" IDE-Festplatte ausgebaut werden. Man wird nicht extra Betonen m&#65533;ssen das die Festplatte auch in ausgebautem Zustand empfindlich gegen Ersch&#65533;tterungen und Schl&#65533;ge ist.

Da nun das Floppylaufwerk entfernt wurde kann man bereits die Sound_In-Buchse sehen, ebenfalls die drei Spulen mit Ferritmantel und den LM387 der hier als Analogverst&#65533;rker dient.
Viele der zum Analogteil geh&#65533;rigen Bauteile befinden sich auf der Unterseite der F030-Hauptplatine, um dort Messen zu k&#65533;nnen mu&#65533; die Platine komplett ausgebaut werden. Also erstes kann nun mit einen ganz einfachen Digitalmultimeter an der rechten und linken Ferritspule getestet werden ob die Audio-Signale bis wenigstens am Ende der Spulen anliegt. Auf den Millivolt-Bereich geschaltet sollten sich an jedem der beiden Kan&#65533;le Spannungsschwankungen gegen die Rechnermasse messen lassen. Ist das nicht der Fall liegt der Fehler mit Sicherheit schon an der Buchse. (Selten)

Der Falcon mu&#65533; auch nicht unbedingt In Betrieb sein um diesen Fehler zu finden. Die Audiosignale lassen sich bei abgeschaltetem Computer leicht bis zum CODEC verfolgen. Ausserdem l&#65533;uft er auch mit ausgebautem Diskettenlaufwerk :-)
Auch nach den Spulen, in Richtung des LM387 sollte sich am Multimeter bei angelegtem Stereo-Audiosignal noch was tun.
Nat&#65533;rlich zeigt das Multimeter keine genauen Werte an, sondern eben nur das ein Signal vorhanden ist. Das &#65533;ussert sich mit 'h&#65533;pfen' der Anzeige.
Besser w&#65533;hre hier ein Oszilloskop, was aber eben leider nicht jeder hat.

Liegen die Sterosignale an den Spulenenden an, ist man einen Schritt weiter.
Die Klinkenbuchse und die Spulen k&#65533;nnen hier ausgeschlossen werden.
Die mittlere der drei Spulen hinter der Klinkenbuchse liegt &#65533;brigens im Masseanschlu&#65533; der Klinkenbuchse und dient zur Entst&#65533;rung.
Man sollte nun am LM387 an PIN2 (Microphone Left In) MLI und an PIN7 (Microphone Right In) MRI feststellen ob die zuvor an den Ferritspulen gefundenen Audio-Signale hier auch noch ankommen.

Ist das nicht der Fall verschwindet das Signal bereits auf dem Weg zu eben diesem Analogverst&#65533;rker. Das war bei einem Falcon der Revision B der Fall.

Wenn man von oben auf den Rechner dr�ckte (Floppyseite) war der rechte Kanal mit Kratzger�uschen und Aussetzern verseucht. Nach dem Ausbau der Platine konnte man sehen das sich die L�tanschl�sse der Spulen und einer der Klinkenbuchse bereits durch die Pappe einen Weg zum Masse f�hrenden unteren Abschirmblech gebahnt hatten. Was nat�rlich sofort zu einem Kurzschlu� des rechten Audiosignals f�hrte.
Abhilfe konnte ich dadurch schaffen das ich die Bauteilebeinchen einfach entsprechen gek�rzt und die Bauteile erneut eingel�tet habe.
Die L�tbatzen waren an den Auflagestellen schon eingedr�ckt.
Das Floppy war in diesem Rechner �brigens nur original ganz leicht Angeschraubt, ein festziehen der Floppyschrauben h�tte den Fehler wohl eher an den Tag gebracht. So z.B schon bei der Endkontrolle des Falcons!

Die Abschirmbleche liegen �brigens schon in der M�lltonne !
Die braucht kein Mensch :-) (Ausser vielleicht einigen Postkaspern)

Bei dem zweiten Falcon hatte ein Aussetzter des linken Kanals die Rechner�ffnung zur Folge. Nach dem ich alle Schritte die ich bereits Erl�utert habe durchgef�hrt hatte blieb ich wieder an der Befestigung des Diskettenlaufwerkes h�ngen, auch dieses Laufwerk war nur lauwarm Angeschraubt.
Bei korrekten Anschrauben und ca. 5 Min. Samplen war dem linken Kanal kein Ger�usch mehr zu entlocken. Um sicher zu gehen kann man die Ausganssignale des LM387 (U9) am F030 CODEC (U28) messen, und zwar ist PIN25 des CODEC �ber die SMD-Bauteile C128, C124 und R133 f�r den rechten Kanal zust�ndig (MRO) PIN27 des CODEC �ber die Bauteile C131, C129 und R145 f�r eben den linken Kanal verantwortlich, erst der CODEC �bernimmt die Wandlung in die digitale Form.

Bei diesem Falcon war es offensichtlich nun so das sich durch das ebenfalls Verspannt eingebaute Diskettenlaufwerk auf der Platinenunterseite die Bauteile C40, C26 nicht mehr so ganz korrekt verhalten haben.
C40 hatte nur bei kaltem Rechner Verbindung mit seinen L�tstellen, C26 mu�te durch einen neuen SMD-Kondensator ersetzt werden.
Das Audiosignal des linken Kanals lag an der Spule L33 korrekt an, auch am Spulenausgang in Richtung des LM387. Leider konnte man aber dort am PIN2 kein Audiosignal messen, also mu�ten alle Bauteile die sich in diesem Schaltungszweig befinden unter die Lupe genommen werden.
Das mit der Lupe �brigens im wahrsten Sinn des Wortes !

Ben�tigt habe ich hierzu nur das Multimeter, bzw. den darin eingebauten elektronischen Durchgangspr�fer. Das Oszilloskop habe ich erst nach der eigentlichen Reparatur genommen um zu sehen das die Signale auf beiden Kan�len auch noch nach dem LM387 (U9) korrekt aussehen.
Nur damit es nachher keinen h�rbaren Unterschiede zwischen beiden Kan�len gibt.

Bei dieser Gelegenheit ist mir dann auch aufgefallen das beide Falconplatinen auf der Unterseite aussehen als wenn die kein Fachman gel�tet h�tte..
Viele der SMD-Bauteile sitzten entweder total schief auf ihrem Platz oder sind so Mangelhaft verl�tet das man sich �ber sonst nichts zu Wundern braucht.

Eine genaue Beschreibung aller Bauteile die sich in diesen Signalwegen befinden w�rde sicher den Rahmen dieser einfachen Fehlerbeschreibung bei weitem Sprengen.

Deshalb hier nur kurz eine Zusammenstellung der Bauteile vom Klinkeneingang
bis zum CODEC (U28).
Linker Audio_IN-Kanal:
L33, R57, R58, C21, C26, R58, R87, C40, R55, LM387 PIN 2
vom LM387 PIN4 bis zum CODEC: C131, R133, C124 CODEC PIN25
Rechter Audio_IN-Kanal:
L35, R92, R90, C81, C79, R84, R88, C55, R87, LM387 PIN 7
vom LM387 PIN5 bis zum CODEC: R145, C129, R131 CODEC PIN27

Die Beschreibung dieser Bauteile bezieht sich auf die Revison B (OLD)

Zu Bemerken w&#65533;hre noch das sich neben PIN 25/27 am CODEC jeweils eine
Durchkontaktierung befindet an denen sich besser Messen l&#65533;sst als an den
Anschlu&#65533;beinchen des Codec selber.
Sollte diese Aktion jemand nachstellen m&#65533;ssen so sei noch zu sagen das es
unumg&#65533;nglich ist alle Sicherheitsvorschriften bez&#65533;glich der Netzspannung,
dem Umgang mit einem SMD geeigneten L&#65533;tkolben dem Werkzeug und der
Schutzvorschriften bez&#65533;glich statischer Ladungen einzuhalten.
Ihr Falcon und die sechsfache Multilayerplatine werden es Ihnen Danken :-)

Alle Leiterbahnen der AUDIO_IN Schaltung befinden sich zum Gl&#65533;ck auf der
Ober- oder auf der Unterseite der F030 Platine, sogesehen als noch ein
recht einfaches und schnelles Unterfangen.

An dieser Stelle sein nochmals eindringlich vor dem Verbiegen, Verspannen oder
sonstwie stark mechanisch Belasten der Multilayerplatine gewarnt.
Viele andere Verbindungen liegen in den inneren Schichten..
Da hift auch Anbohren nicht weiter..

Eine gewerbliche Nutzung ist Untersagt!

Does somebody know which driver manages to make an Okipage 4w print on a Falcon with NVDI 5? I tried the included laser-drivers without success.

Greetings,
Thomas.

That's clever. Very clever.

> >Andreas really should implement those few AES 4.1 features
> >that are still missing and upgrade his AES version accordingly. Why he
> >stubbornly refuses to do so is completely beyond me.....
>
> AES 4.1 is buggy, so why should he implement buggy features?

hum..
hummm.
How can I put that without hurting your feelings.
hummmmm.
Oh yes!

Dear Dennis,
The buggy parts of AES 4.1 (gem.sys) are not because of the features
themselves. But how they were implemented.
As in, magic supports menu_ienable() (aes 4.1 also afaik)
if menu_ienable() in aes 4.1 is buggy. That doesn't mean that on magic it
will be buggy. This is a call,. Now it is up to the author to take care of
the bugs within this call.

Now, want to talk about buggy implementations?
Hint: it starts with a "W" and ends with "dialog"
The calls might be good and interesting (which they actually look good).
But I hope, b2b or whoever the exact author is, make this piece of
software better than it is.

If you'r searching for a real news-server (not a WEB-based one) have a
look at
http://www.jammed.com/~newzbot/
There are lists of free servers sorted by different criterias (speed
etc.).
There is also a link where you can search for servers carrying a special
group
like "comp.sys.atari.st".
An other WEB-based server is
http://www.supernews.com
which is very fast but uses really complex html pages.

2516. Atari ST Books For Sale

Newsgroup: comp.sys.atari.st
Date: 1999-02-07 00:00:00 UTC
From: bretelle@autonet.net
Message-ID: <36be0377.579842518@news.provide.net>
Source record: 84753

Still have a few Abacus ST books left, and a few additions since the last list.

These books are full of valuable info for your Atari ST, and are getting hard to find. Get them while you can!

Prices are $10 each, add $2.50 per order for shipping to US addresses.

Make me an offer on bundles, or the whole lot - I'd just as soon package them all in one big box!

ABACUS ATARI ST BOOKS:

Volume 5 - Atari ST Tricks & Tips -

Valuable collection of software tools and programming hints. GEM, BASIC, Machine Language, TOS, RAMdisks. Contains program listings and color plates.

Volume 8 - Peeks and Pokes -

Use BASIC Peek and Poke statements to customize the desktop, change the mouse pointer, read the keyboard or joystick and much more.

Volume 9 - Atari ST BASIC Training Guide -

A functional, educational and well written introduction to ST BASIC. Helps teach programming quickly, includes quizzes on the material covered.

Volume 13 - ST Disk Drives Inside and Out -

Covers the capabilities of Atari ST disk drives - concepts and techniques of floppy disks, hard drives and RAMdisks. Includes file structures, controllers, tracks, sectors, clusters, BIOS, DMA, gaps and FATs. Includes a listing for a full-function disk monitor program to investigate the ST's Disks.

MISC ATARI ST BOOKS:

Compute's ST Programmer's Guide-

Comprehensive guide to programming the ST. Includes dozens of example programs, details on accessing advances features of the ST, includes info on writing GEM applications in "C".

Compute's Technical Reference Guide -Atari ST Volume 1 -

Very complete guide to the Virtual Device Interface (VDI), the ST's built-in graphics routines. Includes program examples in C, machine language and BASIC. For the intermediate to advanced Atari ST programmer.

Compute's Atari ST Machine Language Programming Guide -

Your guide to 68000 machine language on the Atari ST. For both the experienced programmer, and those with only some programming knowledge in C, BASIC or Pascal. Includes sample programs and examples for the commonly used 68000 instructions, and a close look at the ST operating system.

Compute's Learning C - Programming graphics on the Amiga and Atari ST -

Filled with useful information oriented toward making the most of the graphical capabilities of both the Amiga and the Atari ST. Shows you how to use C to create dramatic graphics with specific libraries of routines for both computers. Includes many programming examples.

Atari ST Application Programming - Bantam Computer Books -

Covers the AES and VDI services built into the Atari ST and shows you how to use them to create your own complex applications under GEM. Includes many programming applications, charts and lists.

Programmer's Guide to GEM - Sybex -

Very detailed reference guide to developing applications for the GEM operating environment. Programming VDI, guide to AES, the Resource Construction Set, and lots of examples in C.

GFA BASIC Book - MichTron -

Intermediate programming tutorial for GFA BASIC written by Frank Ostrowski, the author of GFA BASIC itself. Guides you through the intricate facets of GEM programming using GFA. Comes with a disk containing programming examples. Very detailed and interesting!

Keyboard shortcuts depend on the application. You can also click with
Alt-Insert and use Alt+cursor keys to move the mouse.

You can get a new mouse from just about any Atari dealer near you. The
hardest part is to find a dealer near you.

Hi Martin,

Many thanks for your help - it worked a treat.
Question though; why pack the file twice in the first place ?

Anyway, I am off to do lots of reading before trying to install this
Mint package - wish me luck !!

ATB

Jim.

I think the Okipage is a windows only printer, and won't work with
anything else. The OL400E and most of the others will work with an HP
IIP driver.

Cheers
John

No, I'm not kidding about comp.sys.atari.st.misc. The other posting in that newsgroup, from a fella in Holland, is now two days old. My original posting here was also sent to 'misc', so there's now two of 'em at my end. In my opinion, though, comp.sys.atari.st.misc is redundant.

My 'lurking' is due to the fact that I have a new ISP, one that I chose because of its excellent newsfeeds.

BTW, a search for 'Atari' came up with these newsgroups:

Hi!

James Smith <jimsmith@zetnet.co.uk> wrote:
> Question though; why pack the file twice in the first place ?

This is one thing which gets misunderstood quite often: tar (Tape ARchiver) only creates a large uncompressed file which contains all files you want to have in it. This is perfectly OK, as tar is also used to make backups to DATs and similar storage, which almost always have built-in compression.

But for file transfers, it's nice to have a smaller archive, so you /now/ pack it using compress (very low compression rates, almost unused today, giving the extension .Z), gzip (good compression rates, reasonable speed and the de-facto standard for compressing single files in the UNIX world, giving the extension .gz), bzip2 (even better compression rates, but considerably slower than gzip, giving the extention .bz2). But you're free to use any other compression tool, if you like.

The benefit of first creating one big archive which is compressed afterwards are the better compression results, as there's no compression header for all files, but only one. Also, assume you had 4 files with quite similar contents, pack them using zip or lha, and you result in an archive which contains 4 files with smaller size. But with tar+gz (or any other packer), you get a much better result as the 4 files can be crunched to one smaller block and the additional info that it's used four times.

(For example, the above paragraph in four identical files results in a 1550-byte .zip and a 455-byte .tar.gz. A similar test with a bit larger text files resulted in a 1545:5518 for tar+gz.)

The file extension .tgz, as often used with MiNT packages, is a tribute to the fact the .tar.gz cannot be used on the 8+3-filesystem you usually have on the Atari.

Another note: When already running MiNT (and having gzip accessible through one of the directories given in $PATH), it's possible to do both steps at once. I.e., instead of

```
gzip foo.tgz
tar xf foo.tar
```

you just use

```
tar xzf foo.tgz
```

Uh-oh, written too much boring stuff again, I fear ...

Ciao

I wouldn't bother with a TOS partition (don't know if you can do that anyway...)

There are some pretty good ST emulators for PC which will read directly from a PC hard disk directory as if it were a TOS partition. (files in that directory are readable from Windows too).

Take a look at http://lgd.fatal-design.com/ : The Little Green Desktop where you will find downloadable versions of the shareware PacifiST emulator plus various TOS ROM images which the emulator requires. The emulator will read ST floppies (after a fashion), but there are also programs which will read ST floppies in the PC drive and convert them to disk images for use in the emulator (a better option).

As a lapsed ST user, this emulator brought a tear to my eye!

> a TT or clone should be able to handle this no problem.. ;-)

PS: when I was in Canada, my TT (on a full KGMD setup) was pretty much online 24h/day where it functioned as an FTP and HTTP server (among other things). I haven't experienced more than five simultanous connections, but even then it was still usable for other stuff while FTP/HTTP requests were being served.

On a TT or Hades/Milan, Linux 68k or NetBSD/Atari are interresting alternatives, if you intend upon using one as a full-time server.

In article <Pine.LNX.3.96.990208105707.27274B-100000@hal.fishpool.com>,
Martin-Eric Racine <q-funk@pp.fishpool.com> writes:
> tar zxvf foo.tgz
>
> if you want a verbose listing as it extracts.

And want to wait ages for larger archives ;) I never understand why some
people often use 'v' for creating and extracting tar archives, as it
takes a lot of time to print the names, especially on graphical
terminals like TosWin or xterm.

I just take a quick look into the archive using

tar tzf archive.tar.gz | head

to see whether the archive creates its own subdirectory. After that, I
extract without the 'verbose' option.

> Btw, when using a
> decent commandline shell [...]

Well, --help should also work on the most dumbest shell, provided it is
able to pass commandline arguments ;)

Ciao

2546. Building new page about VME graphic cards ...

Newsgroup: comp.sys.atari.st
Date: 1999-02-08 00:00:00 UTC
From: dipching@ping.be
Message-ID: <36bf0f14586252@ping.be>
Source record: 84706

I'm planning to build a brand new page about any VME graphic card (any kind existing ... Nova, Matrix, Cyrel, Crazy Dots ...)

Because today it's more possible to find such cards in second hand and a lot of people do sell them without the drivers or the latest drivers ... I suppose it could be interesting for new users ...

I have already made one about the Crazy Dots but really would like to create a new one about Nova and others ...
I know some people have already done some e.g. Mr Holleman for Matrix cards ...

If you own ANY information, files, pictures about ANY VME card I will be happy to assemble them in a whole dedicated site ...

Of course, during this time, my Crazy Dots related page is always available at:
http://ping4.ping.be/dipching-drulkhor/CRAZYD-E.HTM

Thanks

Jo

>Falcon with NVDI 5? I tried the included laser-drivers without success.

Unfortunately, the OKI 4W is a printer which works with Windows and
nothing else - you can't even use it in regular DOS on a PC.
It simply can't be used with an Atari.
If you're looking for a printer - check that it works in DOS first of
all. It's a good thing if it's HP compatible - then it will probably
work with all programs you have on the Atari.

A standard ST will definitely not be able to do this, neither will a standard Falcon (unless it's a low-traffic site). But with an accelerator and more memory (atleast 32Mb) it would definitely work. I actually had my Falcon/AB running both a http- and ftp-server at my university about 18 months ago, no problems there.

The real problem is that no TOS-compatible OS has virtual memory (the code in MiNT 1.14.x is too bug-ridden to be usable), so memory-fragmentation will probably cause problems which only can be solved with a reboot :-(Once MiNT get real paging this problem will go away.

I suspect the 630 should work. I recently traded some Atari equipment for a Quadra 610 to use as a MagicMac machine. As I haven't done this yet, I'd be very interested in what you discover.

2555. Programming the ST

Newsgroup: comp.sys.atari.st
Date: 1999-02-08 00:00:00 UTC
From: Andy Blakely <andy.blakely@pnl.gov>
Message-ID: <36BF2FFC.B0E4BCF8@pnl.gov>
Source record: 84715

Hi,
I'm starting to learn the C language and was wondering if there's any free compilers I could download for the ST.

Also I have GFA BASIC 3.0, but don't really see the point of it. If I wrote a program in BASIC, nobody could run it unless they also had the GFA BASIC on their system, right? Or is there a way to make programs executable?

Thanks in advance,
Andy Blakely

2556. Background pics with Thing v1.27e?

Newsgroup: comp.sys.atari.st
Date: 1999-02-08 00:00:00 UTC
From: thechyld@pcc-uky.campus.mci.net
Message-ID: <79ncgt$1ia$1@news.campus.mci.net>
Source record: 84716

Hmm...I know this topic has been covered before, but... ;-)

I'm attempting to convert JPEG pictures into 256 color IMG files for use as background pics with Thing v1.27e. I'm using Imagecopy 4.1CD, and after reading the docs, I set matching, remap pallete, 8-bit, floyd-steinberg dithering, and in succession, I tried the Atari, Uniform, Adaptive, and Screen settings. These conversions are successful, in that I gain 256 color IMG versions that Thing will use (I tried 24-bit, but Thing refused to load those), but if I run software like Aniplayer or 1st Guide, the screen (desktop) colors go crazy. (and some pics looked good, but changed my Icons and windows/dialogs). I d/led K.Ellis's background pics, both 16 and 256 colors, but had the same results when I use them. Oh, I tried "use image pallet" (and not) from within Thing as well...

Thanks in advance for any insights into this! ;-)

>Please post it here and/or e-mail me.

If you've got the memory to spare simply load it into RAM as
a TOS image. Its available for download on various emulation
sites and I think its only 256k in size anyway.

A permanent swop over to 2.06 will probably mean lower
compatibility with older software. Games mostly.

Theres also a patch version I think which works with the old
TOS and merely updates certain OS routines to 2.06 spec. I
think thats only about 120k in size.

>
>Regards
>Danny
>--
>Denesh Bhabuta

Atari Computing is edited solely by me.

My main machine is a Duo280 powerbook running MagiCMac because that
offers
me reasonably fast portable Mac and Atari computing.

I also have a PC which I use almost entirely with MagiC PC, Gemulator,

STemulator and TOSBOX.

I have many real Atari machines which are used for testing and other
ancillary tasks including: Atari Mega ST4, 4Mb STFM, 2 4Mb STe
machines
and probably a few others kicking around I've forgotton about.

Atari Computing magazine is edited using Everest and That's Write then

laid out using Papyrus v4 on a real 14Mb Falcon machine by Mike
Kerslake
with some pages laid out by me using the Atari version of DA's Layout
running under MagiCMac. All pages are output on a Hewlett Packard

Laserjet
4 at 600dpi.

There are many screenshots taken under MagiC because most of the main contributors run MagiC and it's a PITA to switch OS just to take screenshots. There's nothing sinister about this, it's just practical.

We're proud of our Atari credentials, what's the problem?

Regards

Joe Connor

>Hmm.... Some people really are dumber than life.... ,-(

I know - weird - they probably saw that I have cyberstrider.net and
cyberstrider.org and then thought they would try and see what happens
if they registered the .com equivalent. The funny thing is that the
name means nothing to anyone else - there is a history behind the name
- one that nearly everyone will not be able to work out how it came
about... and it is a name personal to me as I made it up. So am
surprised if the other party claim that it is their name.

>Well, I just hope they have some dignity enough to offer it to you for
>kindness...

Ha - then I will be surprised...

>> Do tell me though - and I ask this for educational purposes - can a
>> Falcon/ST running MiNT run as an Internet services server in much the
>Falcon, I doubt it -unless you install a CT2 or something in it, but
>a TT or clone should be able to hanlde this no problem.. ;-)

See, a slight problem here is that I don't have a TT or a clone. Yes,
I guess I can buy one but I have orders from my wife to keep my
computer equipment at a low level - she wants me to get rid of most of
the computer kit I have as it clutters up our home. ;) So much so that
my large 17" monitor has now been replaced with the same size screen
desktop TFT screen - and I can not complain. ;)

Additionally, we have to face the fact that running Unix on a PC
platform is much cheaper than on an Atari platform when you consider
the price of buying the two different hardwares.

One more question - what is the ethernet situation like on the TT
Clones? I was unable to find a satisfactory solution when I was last
at the German show...

>See the TT030 homepage for a glimpse at the package.

Sorry - I could not find it.. please point me in the right direction -
I've probably missed it...

That's because some apps change the palette. The system-palette
consists of the first 16 colours and should not be changed, but the
rest can freely be changed by any application. The application must
however restore the palette upon exit, there are some apps that
doesn't do this.

You need the proper cable, is must have a D-sub connector in one end
(Zip) and a 50 pin SCSI2-connector at the other end (Falcon). These
are usually quite expensive.

> p.s. Where is the best place to get the latest version of HDriver? I am

Where do you live? In the UK both System Solutions and Titan Designs
has HD-Driver.

Shouldn't be a problem, but I don't know if it supports the special
Zip-features (e.g. password-protection).

Try this method from Imagecopy's author:

Set Options/Screen/Mapping/Palette to 'Screen' with 'Match Colours'
selected, and display the image in the appropriate screen resolution
before saving it in IMG format.

Another method to try (courtesy of Daron Brewood):

Set Screen/Mapping/Palette to 'Screen' with Match colours selected,
Remap palette is off.

Preferences/Image has only the top click box clicked.

Persoanlly I remember trying Daron's method and it worked absolutely
fine in 16 colours, no reason for it not to in 256 I guess!

HTH

Kind regards

No, there is no conflict, but when you use the TOS/DOS compatible
partitioning supported by HDDRIVER you don't need additional software
like Big-DOS at all. Questions to Big-DOS should be directed to the
author Rainer Seitel: Rainer_Seitel@ka.maus.de.

My recollection is that the fonts must be registered to the program serial
number. If that is true, you'd need to get ahold of one of the
distributors. Codehead was the US distributor, but they're long gone. :(

2575. Video Key Power Supply

Newsgroup: comp.sys.atari.st
Date: 1999-02-08 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <79oe49$cql@james.hwcn.org>
Source record: 84735

Somebody recently posted asking for the specs on the Video Key powersupply
for the 2600.

Here they are:

12v DC
300mA
1/8" Positive Tip

This will be very easy to find at any Radio Shack or electronics store.

Some tips on using the Video Key:

Have a colour monitor plugged into it when you use it or the video will
appear washed out. The composite signal comming of this device isn't
spec. (almost every Atari device since the 2600 has used non-spec. video)
The signal is actually a little too hot. If you're using it to record your
own animations to video tape (that's why I bought one) then you should
reduce the luminance value of your colour by 25%, especially red which will
bleed like crazy. You will notice a dark band scrolling through the picture.
There's nothing to be done about this. If possible use a dark background
in your animations and it won't be as noticable.

It's an okay device. I bought mine way back when they first came out, for
$125 (ouch). You can probably get them now for around $10. I really wanted
to be able to record my cheesy animations from Epyx Art & Film Director
on video tape. It's kind of funny, back then they were just warped,
cheesy animations. If I were to do them now adays people would think
I was trying to rip off South Park. :)

I've opened mine up to see what it is. It's a pretty simple circuit, but
one large section of the board is buried under epoxy (@#$@#%!!!!)

There is a jumper on the beastie to set it from NTSC to PAL, but I wonder
if this will allow a PAL machine to output NTSC composite and an NTSC
to output PAL composite, or if it is only to select the type of machine
it is running on.

CRACKERS
(Maybe I'll make some new ones from hell!!!!)

I know I'm a little late in replying, that's what you get when you use a
PC for internet stuff.

I do absolutely everything on an Atari (STE). Not only is it reliable,
easy to use, quicker to boot up it cuts down on my swearing as well.
With PC's (I used to think that 'PC' stood for personnel computer!!)
you have to hold your breath and hope it gets to the desktop, with the
Atari's you know it's going to get there;)

The only thing I used to use my PC's for was web browsing, now I use my
PC's for all internet work and games (Quake, Quakeworld, Hexen 2 and
soon Quake 2).

Wouldn't it be nice if someone could come up with a multiplayer game
that could be played over the internet for Atari's.

The Atari has still many years of life in it, and the PC's can't even
match the MIDI's reliability let alone get the timing right;)

One very good reason for using a mono monitor as opposed to just the
colour one, and that it's easier one the eyes. If you are going to spend
a long length of time you will soon appreciate it.

I find it also give an accurate picture of what you would print on
paper; Calamus only runs in mono, and I use it for all my DTP work;
Timeworks I could never get on with using med rez.

ROTFL!

MiNT and MiNTnet happened _way_ before I-Connect and have supported
the UNIX standard PPPD since ages. Then STinG supported PPP also.

> >I just e-mailed Oliver Buchmann of ASH yesterday,
> >to request English programming docs for Magic. His reply?

Now, _that_ is brilliant. Maybe all Atari users should learn German,
so that fututre versions of NVDI and Magic don't need translation.

No sitten, eikï¿½ Linux kï¿½yttï¿½jï¿½t tarvitavat opia suomea vielï¿½, koska
sielï¿½ on suomalainen kï¿½yttï¿½jarjestelmï¿½? No kyllï¿½! ;-)))

> >Andreas really should implement those few AES 4.1 features

>
> AES 4.1 is buggy, so why should he implement buggy features?

Features are features. (Buggy) implementation of these is another.

Both Geneva and N.AES implement them in bug-free ways, so why can't
Magic do that too? Besides, all those features are _documented_and
official thus found in The Atari Comnpendium.

Translation:

I own 2 Atari 520 (ST and STE), one of which is equipped with 4Mb.
Is there an OS9 that runs on 520 or 1040ST ?

Can you adapt a PC screen on these machines ?
Thanks.

Reply:

Please use fr.comp.sys.atari if you wish to speak french only.

I'm quite sure I saw an advertisement for 68K OS9 in an ST Magazine
once, but I've no idea where you could find it nowadays.

You can adapt a VGA screen, but it will only display monochrome
high-res. Check out the Quick FAQ for details.

As far as I remember you need to set all the relevant options EACH
TIME you use the program as, in the demo, 'Options' are not saved.

I think you will find that it will work if you load-it, set-options,
translate all in one session. If you then re-load the prog. it will be
back to square one.

I have a book with schematic and software, but it is copyrighted, so I could not put it on WEB site. I can send it only by E-mail, for personal usage.
Btw. it is really simple, and not expensive.

It really deletes the messages that you've "deleted" when you close a group window or when you quit the program.

It seems to be slower to run after it's been loaded tho'.

>I do like the count-down feature when downloading the NG items though.

Very welcome!

Thanks to Roger Cain, there is now an English Readme and RSC file for the configuration utility of Steffen Engel's CBHD502 hard disk driver available (it's on my web site, address in sig).

Whilst this isn't a translation of the complete package there should be enough information to install it.

The driver itself should be widely available on many ftp sites.

I'm not sure I understand exactly what you want to do. I don't think you can make a TOS partition on a PC that would still be readable by DOS. What you can do is format your ST's hard drive with a DOS partition, with bigdos or HD Driver, to make it readable on both systems. This would be for swapping the hard drive from one machine to the other, but I'm not sure this is what you're after.

If you are thinking about emulating an ST on your PC, this is possible. There are several emulators out there. Have a look at the Quick FAQ for links. Emulators usually use a directory of your hard drive as if it was the ST's hard drive.

Maybe you were thinking about connecting the ST to the PC to tranfer files and stuff. This is also possible, but not always very practical. Check out the Quick FAQ.

Me too, but you make me curious. What could have been better
in Pure C. After I got PureC I stopped looking around, because I thought
it was more than good enough.

Is it generated code?
Level of optimization?
Complyance with ANSI standard?
Or just a few bugs.

A short hint is enough.

Thanks in advance.
Greetings.

Henk.

Hallo!
Eine Freundin von mir mi¿½chte sich aus nachvollziehbaren und
guten Gri¿½nden nicht von ihrem MegaST2 trennen, hat jedoch
unter Papyrus 3.0 das Problem des unprofessionell wirkenden
ungleichmi¿½i¿½igen Schriftbildes.
Lohnt da eine Aufri¿½stung von Papyrus?
Oder ist das systembedingt?

Dazu folgende Fragen:

1.) Gibt es eine wirklich preiswerte - am besten kostenlose
- Mi¿½glichkeit dem AtariST die Benutzung von TrueType Fonts
beizubringen?
Ich kenne bisher nur die Mi¿½glichkeit fi¿½r unerhi¿½rt viel Geld
NVDI zu erwerben, um diese Mi¿½glichkeit wahrzunehmen.

2.) Ist die Bildschirmausgabe und die Ausgabe auf einem
Drucker beim ST eigentlich mehr oder weniger gekoppelt?

ciao

Note the last current link, http://www.dsoe.com/people/roughley/tms.htm,
still exists but will expire shortly.

The permanent home of "What is TOS?" has changed, too (the Cranach page
being a part of it).

> back then...
>
> *shrug*

I see this so often -- previous Atari users with no conception of what
has progressed since the days of 640x400. Their minds are forever
steeped in the screens of Degas or the desktop of TOS 1.x.

Sure a 300 MHz Mac is nice (I'm running one right now), but my TT is
still very efficient considering the difference in processors. My TT's
overall screen display (800x600), for instance, is almost as fast as my
Mac running OS 8.1 (only the update to 8.5, with its native PowerPC
rewrite of QuickDraw, made it noticeably faster).

This is just one example of what good, effecient code can do. Combine
that with some of the excellent 'Atari' software available and one still
has a viable machine.

The guy who runs the trailer park I live in, is making some extra money by building computers for people. Today I was watching as he set one up for a guy here in the park, a 486 33mhz with 8megs of ram, a cd rom, hard drive and afloppy that'll die very soon.

The guy wants it for printing flyers, banners, etc. after they loaded windoz98 into it, they don't have even enough ram to play a game with!

Now to me that is a JOKE! and all I have is 4megs ST and 4 megs TT. Oh they put in a 4 gabyte drive and he's only got 2ga's of empty room left after putting windoz onit!

Hi. How did he load Windows 98 onto a 486 33MHz machine? I will now copy
from the side of the upgrade CD box:

System Requirements
*486DX/66 Mhz or higher processor
*16 MB of RAM; more memory imporves performance

Even with every single option added, even while using FAT 16, it doesn't
take over 400MB of space. Also, if the buyer is only wanting to print up
some flyers, an older machine would do fine and save the guy some money.

Thank you,
Jason Whorton

I have both PC exchange and MacLink installed, but must work with M$
Word 6.0 files which are read-only & password protected (receive 'em
from Germany and cannot ask to change this order of things). Word 6 is
too big and slow for my Mac. Even the newest version of MacLink cannot
translate read-only & password protected Word 6 files, but Papyrus
built-in converter under MagicMac does this very well!

> I haven't really used it as I rarely need anything like this.

You are happy; we, in Latvia, have at least three different font code
tables on Mac platform and four on Windoze, and they aren't compatible.
Of course, there are some (commercial) translation utilities, but none
works perfectly. Just suppose you have a 20 page document after
conversion from Mac to PC, and there are some 30 incorrectly converted
characters (with diacritical signs). Too much or too little? Go, correct
them...

MagicMac gives me possibility to use Windoze TrueType fonts, so no font
code table conversion is needed.

> As time goes by I get more and more impressed with what Atari software
> can do, and with a modern platform like a Mac with MagiCMac it's just
> amazing! (I have both an STe and a 68040 Mac with MagiCMac).

BTW is MagicMac an Atari ST emulator or an alternative OS for Mac? I
think, it should become the latest if ASH wants to earn money with it
:-)

> > Just my two cents...
>
> Didn't know they used cents in Latvia ;-)

We do have centimes (santimi - in Latvian) - 1/00 of our currency unit
Lats. But one can pay with 100 cents too :-)

Yes, I am aware of this. However what you are trying to tell me is that when
I delete from within the article page, that it is NORMAL to have the a
WARNING appear telling me YOUR HARD DRIVE IS NOT WORKING PLEASE CHECK CONNECTIONS.
Now when I do the same operation from within MAGIC and DELETE from within
the ARTICLE page the ERROR/WARNING message DOES NOT APPEAR.

It does not tell me in the reading that on TOS 1.0 users deleting a message
will flag Harddrive warnings because of the delay and that if you use
Magic it will not display this warning.

You see a warning is not the thing I wish to see on the screen although I am
quite certain no damage is occuring.

I haven't tested it with TOS 1.6 because as I just found out today, The STe
is not SH204 friendly (B&C computervisions add).

Also this doesn't happen on MY FALCON with GENEVA.

The delay fixes a number of previous problems. This version .94 allows me
to use TOS 1.0 which .92 didn't. This saves me memory. Using NVDI and Magic
uses up alot of precious memory as a tradeoff to multi tasking and speed.
As I appear to be the only TOS 1.0 user I don't believe others are having
this problem.

Also while many programmers could care less about TOS < 1.4 John actually
encourages me to tell him what is happening. Some things can be addressed
and others can't.

TOS 1.0 has a delay of its own when dealing with HDs. You should see the difference with Magic.

Having no previous internet experience until last year, and not having touched a computer for 5 years previous to that and then locating and installing Atari Internet software version 1.06 STing, .79 NEWsie, 1.5 Cab with 1.6 ovl and getting it all to work before I even discovered this NEWsgroup and quite Frankly being the ONLY ATARI USER I KNEW OF IN ONTARIO until FINDING THIS NEWSGROUP, I have managed to do everything ONLY BY READING the MANUAL.

The problem now is I forget more often and I now use this group as a crutch, (A good crutch too) and I am lazy at reading many new updates.
This Atari ST is the ONLY computer I have ever used the internet on until after I got it working. I knew bugger all before. I have since seen how other computers work. Could these PC IP morons have ever helped me. NOPE.

Thanks for your reply.

Also if anyone else has run into a harddrive error warning that says check connections please let me know.

I use a 520ST TOS 1.0 with 2.5meg of RAM and an SH204 harddrive.
Also known as a dirt cheap internet computer setup.

Gnu C is at UMICH ftp site, although the FTP link has changed,
you can still http there. Don't know url off hand.

Also I remember people using Sozoban C. I don't know if there are anymore
current ones available.

There are people unload STs with Laser C or Mark Williams C quite often.
Look for Borland/Turbo/Pure C or Hi Soft C used if you can find it.

This is impossible. It is for PC EMULATION ONLY. The only TOS I have been
able to load is a buggy Version TOS 3. thats been kicking around. The TOS
image files are only for pacifist. We all would like to do something that
simple:-).

>
>A permanent swop over to 2.06 will probably mean lower
>compatibility with older software. Games mostly.

THis is true.

You might want to get MAGIC. Magic patches many problems of EARLY TOSses
and gives you the benefits up to TOS 2.0 plus MULTI TASKING. Of course then
you might want a little more ram and a hard disk. But this is cheap now, if you
can still find the boards to hold the ram upgrade.

Thanks MIKE. It was preregistered. Half of my software is and half isn't.
I would like to see my name though. Thanks for the help. It is version 2.
What is the latest version. Is it still supported. I would like to update
it.

I would also like to find Expose. I have an add from TOAD COMPUTERS in 1996
that said they had some. Does anyone know if TOAD has any Atari Stock, and
if not who bought it.

Finally, Thanks to all the other replies for the help. This seems like
a CYBER PAINT on STERIODS.

BTW, I don't believe there are any Atari Dealers left in Canada?
If anyone knows any different, let me know.

Brian.

No, I didn't have an ethernet-card then. I do have one now, but I haven't connected it to my Falcon yet because I haven't had the time to finish the adapter (ROM-port to parallel).

Btw. there are several Ethernet-solutions for machines with VME-bus (i.e. Mega STE and TT), and if you have one of the newer clones with ISA and PCI slots then it's just a matter of inserting a standard Ethernet-card. There's also Ethernet-drivers for ST's with Panther ISA-adapters.

So far there are Ethernet-drivers for MiNTnet, TUW-TCP and STiNG.

> >memory-fragmentation will probably cause problems which only can be

>
> And how often will that have to be?

Depending on the load, your configuration and how much memory the machine has. My Falcon with (then) 16+4Mb could run for a couple of thousand hits (apache) before it started to run out of memory. With proper configuration it should be able to handle much more, but because of this limitation it's not a substitute for a real unix-box in this case.

>
Ronald,

basically any viewer would produce something usable: I did it with Gemview
and Graftool. Problem with Gemview is you can only get a piccie in the rez
that you're currently running. Graftool offers to convert to another one.
Major problem is when running in anything BUT TC, your palette will be
converted unless you tell Thing NOT to use the piccie palette. The piccie
will be shown weird then. I only use BG piccies when running TC, since it
has no effect on other apps or the desktop icons.
You could try to convert to a palette where at least the first 16 colors
are the same as the system palette, but that's a lot of manual work :-)

Not to mention that Thing uses quite a lot of memory for displaying 256
color BG pics! If you have only 4 megs, better turn the option off.

In case the drive had no partitions at all when first starting HDDRIVER,
you have first to partition, then you have to reboot so that HDDRIVER
sees the new partitions and then you can install the driver.

The DEKA will work fine with a Mega ST[e] and TT as well, basically all you need is the correct cable. The keyboard-protocol and it's electrical interface haven't changed since the first 260ST, it's only the layout of the connector that's different.

> Mario, you should build an interface!

He's working on one right now :-)

Indeed. Better supported too. Quite many options as well:
BSD, Linux, Solaris, ...

However, I advocate that a fully upgraded TT running Linux should be
able to handle anything a PC can equally well, for less than half the
price. I intend on proving this as soon as I locate a second TT.

> One more question - what is the ethernet situation like on the TT
> Clones? I was unable to find a satisfactory solution when I was last

The Milan can pretty much use any PCI cards, as long as drivers exist.
For the TT, there are Riebl and Pamsnet VME cards, which are supported
by NetBSD/Atari and MiNTnet.

You must also remember to set ImageCopy to use the BIOS palette,
which is sorted in a different order than the VDI palette.

The IMG format usually assumes BIOS palette order, hence why colours
change why you start an application that uses images (browser, drawing,
etc.)

In TT-high, Color.CPX should show palette values for Black and White.
These are absolute values, so invert the settings for each color and it
should work (assuming Cubase doesn't override this).

IIRC Working Title were the only people that you could purchase
Calligrapher fonts from, and they've now gone out of business AFAIK.
Compo did offer the fonts for sale in Atari World (RIP), but as
they've also gone, I think you're probably best off trying to buy a
second hand copy of the program with some extra fonts included.

Not a lot of help I know, and it's such a shame that these fonts are
not still available :-(((

Kind regards

GrafTool has parameters to protect the system colors during color remapping -- ideal for creating color-safe background images. Select the function 'AES schï¿½tzen' ('protect AES') before converting to 256 colors, and for best results use only true-color source images.

If one is running in extended video (I know you are, Louis), make sure to launch GrafTool in 256-color mode, because from my experience these GrafTool conversions behave differently with a palette-based display, as opposed to none with true-color. And, because GrafTool can be finicky, you can check for palette-swapping right after a conversion, and look at the palette directly, by using the 'Fenster' dropdown menu and selecting 'Colors'.

Although 15- or 16-bit video is nice, I generally use 256-color mode for compatibility reasons. It's in this mode that GrafTool has led me astray creating some caffeine-induced, palette-friendly background images :-)

Oops wrong button.

The TT has two entirely different and entirely disjunct video system.
They operate with different IO addresses (different chips).
1 for TT high (TTM194/5), not a vga modus.
the other is for all other VGA modes
Color.cpx changes the VGA registers only, so above method works
only in the ST high (640X400) mode.

Sorry for that.
Henk.

No, your old PC would have to have a RLL or MFM disk controller, and
even then , there is no way a PC can read a GEMDOS partition.

Are you sure the Megafile's controller is dead ? It's usually the drive
mechanism that packs up first.

Oh, don't bother... :) Today was like the first time in 8 years or so that I
have read something about good ol' Atari... I stumbled into this group and
read and read and read...

I was off Atari after my second ST, went to PC (left' em after the first)
and then to Mac, which was originally the reason why I bought an ST.
Remember? ST looked a liiiiiiiiiittle bit like the Mac but was cheaper.

Well... I miss the times when I was sitting in front of a monochrome screen
doing 640*400. Because I had software that seemed to work very well. And I
never even had the thought of getting more back then.

Now I'm sitting in front of Macs with more than 300 MHz and possibilities I
never dreamed of. Just now and then I think of em good old times...

But tell me, followers of Atari... Is it worth to have all the trouble
getting the hard- and software you need when you could just take a cheapo
Mac or PC? I mean... as far as I know Atari people (and as far as I read
```

your posts here) you wouldn't mind to set up Linux on a PC. And it'd give you quite a nice machine... And a Mac still is the most easy-to-set-up-and-use machine around, along with Mac OS 8.5/8.6... And I guess there really are enough emulators around for any platform...

So... what's the reason to keep a Falcon or a TT besides to have it as a memory for them times? ... I'd *love* to still have my ST, but I sold it back then...

shrug

Patrick.

Several old MiNT packages refuse to compile using more recent libraries,
which is what is causing the delays. As soon as I can locate the problem,
I will produce the first release.

> only in the ST high (640X400) mode.

OK, it worked in ST-High, so I assumed TT-High would work also.
My mistake. Sorry.

It should be easy to code something thta accesses the ECL registers
and reverses all settings, though. Something like an ECL_MODE.CPX
sounds feasable.

madmax@bfree.on.ca (Brian Van TIlborg) wrote:

> Look for Borland/Turbo/Pure C or Hi Soft C used if you can find it.

HiSoft C is an interpreter and not compiler. It can be handy when you're learning C, but not for writing real programs.

If you can find PureC then get it, update the libraries and you have a very decent compiler which is fast even on a ST. It's not the best compiler around, but it's definitely the fastest and has a very efficient and easy to use interface. I use it all the time.

2662. Help: Non-working links UTSI pages

Newsgroup: comp.sys.atari.st
Date: 1999-02-09 00:00:00 UTC
From: tos4ever@ping.be
Message-ID: <36c06bbe1407e10@ping.be>
Source record: 84641

Hello Atarians,

Since the day I took over Jo Vandeweghe's UTSI pages I've been working
steadily on the pages to get then as accurate as possible. Until now I've
corrected a whole bunch of non-working links but alas there are still
quite some links that needs to be corrected but unfortunately I'm unable
to find the right URL.
I wonder if someone know the correct address of the following pages:

-Kosmik Phish Productions: KP flash and KP Sack
http://www.users.zetnet.co.uk/jacquesa/falc_download.html (not working)

-CRANACH demo
http://www.excelprinters.com/tms.htm (not working)
-DEGASART
http://www.users.zetnet.co.uk/sdelaney/downloads/downloads.html (not working)

-DFORM demo
http://www.parx.fr/ (not working)

-OVERLAY II demo
http://www.overscan.com/overscan/preise.html (not working)

-Homepage of Holger Weets
http://members.aol.com/VJanzen/software/weets.html (not working)

-Homepage of Geir ï¿½yvind
http://HINux.hin.no/~goev/software.htm (not working)
http://hinux.hin.no/~goev/software.htm (not working)

well i can't. it pisses me off to have black on white. btw it prevents
from sleeping. white light from a 19" fullscreen screws melatonin
secretion schedule and therefore sleeping.

so if anyone has the way to invert video on tt high it'd be more than
greatly appreciated.

There is your main trouble, TOS 1.0, so full of bugs all the
cans of raid couldn't kill them! You need to replace the tos 1.0
chips with a set of tos 1.4, then a whole mess of troubles will
go away.

Message-ID: <36BFD386.A6D567C9@ericsson.com>
Source record: 84737

I tried to load the zip.faq but the site it was on didn't respond. I just bought a Iomega Zip Plus 100 and need to know how to hook it up to the Falcon.

Do I just use a special cable or what? The manual on the Zip warns to not use special cables other than the cable that came with it. I know they work because I've seen posts here before about people using Zips on their Atari's.

Thanks,

Brian

p.s. Where is the best place to get the latest version of HDriver? I am also interested in using Linux for the 68k. Does anyone know if the 68k kernel will talk to a Zip drive?

From: tconrardy@hotmail.com
Message-ID: <79o1ismis1@news.ncal.verio.com>
Source record: 84741

Hello All:

Finally got my 19" TTm195 fixed at Best Electronics. (I am lucky, they are only 5 minutes away from my house!) and I am soooo glad to have the territory back. My 14 " color was ok, but Cubase is so much better at 1280x960!

My question is...is there a way to have INVERSE VIDEO with TT High? I got so used to using Inverse video with my color monitor, that I woould really like to use this mode on TT High. Xcontrol's Color CPX will not allow you to do ANYTHING with the color scheme.(how about different shades of grey?) So...anyone with a TT using TT high...can you give me any suggestions?

Thanx!

Just a note to let everyone know that I've put a webpage back online.

I hope to be able to continue to offer support to Atari users everywhere, whether itsselling new & used software-accessories-video game items or just offering a place to go for Atari information and a file or two.

Included online is our current product list with prices 50% to 75% lower than we ever advertised before. ST-Falcon software prices start out at 50cents; and we have many accessory items.

Stop by The Computer Dungeon at:

http://www.cyberspy.com/~cdungeon/dungeon.htm

Hope to see some old friends and make some new ones.

Thanks to everyone for your long time support. Email always welcome.

Al Horton

>me;)
>

No they are not that cheap in the United States. Commonly they are sold for around $650U.S depending on the hardware. Sometimes less but rarely. TTs are selling for $500 roughly depending on the hardware. Everynow and then good deals happen, but whenever I am looking the price goes up:-).

I just posted for equipment and the prices I received were crazy on some items. Others were well priced.

I paid $650US for my Falcon Last december. However it came with every commercial piece of software I could imagine, which is what clinched the deal.

I am still opening boxes.

In Canada they sell for similar money but in Canadian dollars.

Also our computers here are for 110volts.

Source record: 84495

I have two SC1224 color monitors for sale. Both of them need repaired,
or you could use them for parts. If you have testing equipment, it
shouldn't be too hard to fix them. One is JVC model with knobs on side,
the other is the kind with knobs on front and push-button power switch.

I can sell them separately and price is negotiable. Please email me if
you're interested or want more information.

Thanks,
Andy Blakely

TT FOR SALE!!!

Atari TT with internal HD (40 Meg.? I think). It comes with the color monitor, PTC1426 and 8 Megs. of RAM (4ST, 4TT) and an external hard drive which I believe is 400 Meg.

With loads of ST and TT software.
I also have a Migraph Hand scanner which can be used with an ST or TT.

All for $450 or Best Offer!!!

I'd like to try to sell locally first - I live in the western suburbs of Chicago.

Chuck

According to the atari specs: b/w on TT is Duochrom modus.
Not only black and white can be shown but 2 colours out of the 256
the TT has.
In normal service are nrs. 254 and 255

>Oder ist das systembedingt?

Wer will das schon. Mit Papyrus 7.09 kann ich das nicht nachvollziehen.
Ich weiï¿½ aber, ich habe Papyrus seit V1, das da wohl einige unschï¿½nheiten
in der Bildschirmdarstellung vorhanden waren. Nicht aber beim Ausdruck.

U.a liegt das auch ein bischen an den verwendeten Fonts.

>Dazu folgende Fragen:
>
>1.) Gibt es eine wirklich preiswerte - am besten kostenlose
>- Mï¿½glichkeit dem AtariST die Benutzung von TrueType Fonts

Nein, das geht nur unter Verwendung von NVDI5 und das ist garantiert
nicht Kostenlos. Mit NVDI kann man Speedo- und TrueType Fonts verwenden.
Lï¿½st die ï¿½lteren Formate ab..

>Ich kenne bisher nur die Mï¿½glichkeit fï¿½r unerhï¿½rt viel Geld
>NVDI zu erwerben, um diese Mï¿½glichkeit wahrzunehmen.

Ob das unerhï¿½rt viel ist mï¿½chte ich nicht beurteilen. Es gibt richtigen
Mï¿½ll fï¿½r wesentlich mehr Geld.

>2.) Ist die Bildschirmausgabe und die Ausgabe auf einem
>Drucker beim ST eigentlich mehr oder weniger gekoppelt?

Eigentlich nicht. Eine Bildschirmausgabe ist etwas anders.

Beim neuen Papyrus kann man sagen das man das was man auf
dem Bildschirm sieht auch so auf das Papier bringt.
Signum ist auch noch so ein gutes Beispiel.

Gruï¿½, Robert

>high.

I think the problem with the Atari ST printer port is simply
its been cut right down to the basic connections there just
isn't enough extra control lines to do anything interesting
with it. However I bet some clever sod could combine the
printer port and possibly another port or 2 (possibly the HD
joystick ports on STe) to make a fully fledged bidirectional
type interface suitable for PC printer add ons. It would
need a software driver too of course. In fact you could
probably use just the two HD joystcik ports on their own for
the printer interface. It would at least put those stupid
ports to use.

In article <BLTVrRR.tandrews16@delphi.com>, dated Thu, 4 Feb 99 23:05:05 -0500 tandrews16@delphi.com stated:

> I saw a DeskJet 400 in Walmart the other day for $98. If what I have
> doesn't work, would I be better off to buy one of them?

It is very likely that Deskjet 400 is a GDI printer, and therefore requires an x86 machine running Windows. (Translation: the printer has minimal intelligence, like an SLM804, and the printer controller software actually runs on the PC). The next models up (I.e., HP712C & HP722C, and the new 697C) are of this type, so I doubt the Deskjet 400 is any different. I believe the lowest cost platform independent HP inkjet is one of the 800 series, which start at about $399. By "platform independent", I mean one that has its own CPU.

Well the guy had a set of floppys, I think about 12 to 15 of
them and he was running some kind of a setup program and kepted
marking yes or no to whatever was loadingup. So I don't know
justhow much or how little of it he got, but he did show the new
owner his C:/ drive and most of it was W/98 files of some kind,
he might have ended up last night with more as the builder said
he was going to delete a lot of un needed files. And they had to
hunt for and install a driver for anold epson fx80 printer which
the guy didn't have paper for to even test! But the builder told
him that he would need to upgrade his ram amount beforehe could
use something like , heck I've forgotten the name, but some big
ms word proc. program. Plus he was showing him how he would have
to run any programs ... Sheees, my old 800xl would be easyer to
use! ;}

I have a Tandberg Data TDC3620 internal SCSI tape streamer with 22 x
60Meg tapes and one head cleaner.

An ideal way for backing up those cluttered drives.

I'm open to offers, if you've got some other hardware or software to
swap etc... postage will be extra.

Go to full-screen mode, press Alt-Help (or whatever you have set up
for copying) and then press Insert. That should make your copy frame
fill the entire window. Then press Return to get the save dialog.
Your saved image should be the same size as your screen.

Well my STe is setup so I can choose 2.06 or the normal 1.62
at bootup using Sboot7 I think. I'll admit though that the
2.06 I'm using is the patch version but it seems stable and
gives me all the features I need. Obviously though being in
RAM means its a bit more vulnerable.

I did think that you could load a pure TOS 2.06 image too as
I can load up a early 1.02 TOS version complete from disk
using a loader and run it without problems. I'll have to try
it with 2.06 before I can comment further.

I think you'll find that this isn't impossible at all its
just in the past when machines were 1MEG no one could afford
to spare a huge segment for a TOS image but now with dirt
cheap 1meg simms theres nothing to worry about. Remember the
original ST used its own RAM for TOS anyway and it was
supplied on disk.

Oh, indeed? Than what OS am I loading into RAM every day these couple of years? TOS2.06 really CAN be loaded into RAM with a proper loader and/or some adjustments. There is that TOSPATCH package that can be downloaded from ftp sites (there are versions for TOS 2.06 and 3.0*). I think that the archive for TOS 2.06 is called TP206V38. It can fix some TOS bugs, change TOS starting address (e.g. from E00000 for ROMs to 3C0000 for a 4MB RAM), change system font or keyboard, customize TOS-embedded RSC files (i.e. you can translate your TOS), etc. Once you are satisfied with modifications it can make files for burning ino EPROMs.

You would need at least 2MB RAM to work comfortably with RAM-loaded TOS2.06 because it eats about 300KB.

And it works nicely. And once in RAM it is reset-proof.

>The only TOS I have been able to load is a buggy Version TOS 3.

To what machine? A custom ST? And it works? Please, give more info.

>The TOS image files are only for pacifist. We all would like to do
>something that simple:-).

>>A permanent swop over to 2.06 will probably mean lower
>>compatibility with older software. Games mostly.
>
>THis is true.

I think just a couple of games won't work (my son would know more about this). And I really can't think of a "serious" program that will not work.

OH, yes: somebody has told me that Cubase wont't work. But I don't know- I am not using it.

>You might want to get MAGIC. Magic patches many problems of EARLY TOSses
>and gives you the benefits up to TOS 2.0 plus MULTI TASKING. Of course then
>you might want a little more ram and a hard disk. But this is cheap now, if you
>can still find the boards to hold the ram upgrade.
>

Well, that is a nice option, too. And Magic can also be burned into EPROMs.
There is even a solution to burn Magic+TOS2.06+CBHD disk driver into a
set of EPROMS so that you can select OS at boot time.

However, having worked for a long time with TOS 2.06 before i tried Magic,
I wanted to make Magic have a similar feel, and I could not on several items
that may seem trivial and yet have made me uncomfortable:

* I could not set desktop icon titles in Magicdesk;
* I could not change keyboard shortcuts for menu items to match those
that I was used to in TOS2.06;
* I could not use the same desktop-icon .RSC file (Magic's ant TOS's are
more-less compatible but must be in different locations and have a
different name) and I wanted to have both OS-es on the computer, sharing
the resources as much as possible;
* Magic (5.1) seemed rather nervous and crached for no apparent reason
more often than I liked;
* I found that, in fact, I did not need multitasking very much.

The alternative jinnee desktop looked much, much nicer than Magicdesk,
but it used toooooo much RAM (and it is commercial).

Cu.

HI!

there is a program called PHEM 3.1 by William Wong.
It is excellent for home money management and it is free, or
sharware, I can't remember.

Can anybody give him the web addy? It is not in the txt files when I
looked on my copy.

You could try putting in PHEM as a word search in your browser

Hope this helps.

From: mhop@snip.net
Message-ID: <36c11be4.25874408@news.snip.net>
Source record: 84571

Fnordadel is a room based BBS program with networking capability to other Citadel room based type BBS's. It is a descendent of STadel, which is a descendent of Citadel, etc.

Someone recently was interested, but I only just (finally) put in on my web page. Several versions are there, and their source code.

Any questions can be directed here or in email, as well as suggestions on the web page.

Aha - something else I would be interested in - will you make this
commercially available?

>Btw. there are several Ethernet-solutions for machines with VME-bus (i.e.
>Mega STE and TT), and if you have one of the newer clones with ISA and PCI

Sadly not on the ST and Falcon machines I had. A Milan seems like a
promising possibility though. :)

>slots then it's just a matter of inserting a standard Ethernet-card. There's
>also Ethernet-drivers for ST's with Panther ISA-adapters.

The only problem with Ethernet solutions on the ST in the past has
been the cost. Certainly prevented me from getting any. Plus if you
went yourown route it meant having to write the drivers - and I ain;t
a programmer...

>So far there are Ethernet-drivers for MiNTnet, TUW-TCP and STiNG.
But no ethernet cards for a bog-standard ST or Falcon.

>should be able to handle much more, but because of this limitation it's not a
>substitute for a real unix-box in this case.
That's the real downer.. if only we could use an Atari for commercial
sites and commercial businesses it would have done that much better.
The main reason my own sites are on Unix servers running on PCs is
because of the price attached to getting an Atari solution and then
the various problems associated with keeping it up and running for any
period of time... scalability, ease of getting parts etc.

You could, but then you would have to find an oooold RLL or MFM (I always forget which) larger than 30Mb. I'm not even sure there were any. Maybe there were some 60Mb units, but they would be old and slow and definitely not very reliable.

Seriously, if you want a bigger drive, you'll have to go and get an IDE or SCSI drive with the corresponding adapter.

Hi,

Anybody interested in a "CARE Electronics" cartridge (made in england)
designed to hold two E-PROMs or UV-PROMs or ROMs , that plugs into the
cartridge port of an ATARI ST ? Right now, it holds two UV-PROMS containing
the Macintosh 128k ROM software (to use the Spectre Mac emulator).

Dimensions : 85mm x 55mm x 22mm

Asking price : $12 or 12 Euros or equivalent, including surface post

Loading 2.06 to RAM is quite possible, I did this on my STe several years
ago. All I needed was a small loader that loaded and started the new TOS.

In fact, if you've ever used WinX and GEMRAM you've done exactly this, except
that GEMRAM copies TOS from ROM to RAM instead of loading it from disk.

Very easy, I used a nullmodem-cable to one of the Linux-PCs ;-) None of the
PCs had decent serial-ports though, so I was stuck at 115k2.

> >connected it to my Falcon yet because I haven't had the time to finish the

It's just the plain TUW-interface, and the only reason why I haven't made one
yet is that I need some time to touch up the PCB-layout. I can make as many
PCBs as I want, so if anybody's interested just contact me for more info.

> The only problem with Ethernet solutions on the ST in the past has
> been the cost. Certainly prevented me from getting any. Plus if you
> went yourown route it meant having to write the drivers - and I ain;t
> a programmer...

The solution is called "MiNT'98", which has several drivers for current ISA-
and PCI-cards. I can't confirm if the PCI-drivers use the semi-standard Hades
PCI-bios, but if it does the same drivers will work on Hades, Milan, Phenix
and Titan's PCI-interface for Falcons.

> >So far there are Ethernet-drivers for MiNTnet, TUW-TCP and STiNG.
> But no ethernet cards for a bog-standard ST or Falcon.

For a ST you simply need a Panther ISA-interface and a el cheapo
ethernet-card, for the Falcon there's currently only the TUW-option. But
atleast two different persons/crews are working on parallel-port drivers for
more current/popular parallel-port Ethernet-adapters. These will probably
only work on Falcons, since it needs the more advanced parallel-port in
Falcons and TTs, as well as some lines from the extended joystick-ports which
unfortunelately isn't present in TTs.

There's also Michael Schwingen's VME<->ISA interface which has been mentioned
several times in this newsgroup.

> >should be able to handle much more, but because of this limitation it's not a

Adding proper paging (with 040 and 060 support, not only 030 as the situation is now) to MiNT is IMHO essential. It has been discussed, but I don't know the status of the project right now.

With paging (and optionally swapping) and memory-protection for 040 and 060 MiNT will actually be a real option for more professional servers, but considering the much faster and cheaper (relatively speaking) PCs with advanced and rock-solid OSes like Linux and FreeBSD it will only be for hardcore fans.

Source record: 84586

Hello,

I got Sting, Cab, Newsie etc. working some time ago, but have never used it that much as it seemed so slow...

Recently I've been trying various things to see if I can speed things up. I have been testing the speed of a link by pinging my DNS, using the IP address not name. That way a slow application will not give me a wrong impression.

I have a standard Falcon and have found that the fastest reliable connection I can get is with the Modem 2 serial port set to 57600bps. I can connect at 115200 but pings take longer - presumably due to line errors. This is with a 33Kbs modem.

At 57,600 the average ping takes 190mS
At 115,200 the average ping takes 223mS

Are these figures normal?

Thanks for any input,

Michael

I'm not a network specialist, but a ping will not give you a reliable
network speed difference. What you could try is to download a real file
from a site in your ISP's own domain. Your ISP's web page or FTP site
could be a good example, this way you will minimize speed variations
between your ISP and the rest of the Internet. A ping usually shows
server response time.

On a 33Kbs modem, 57.6Kbos sounds like an adequat modem port speed. It
should usually be approx. twice the max modem speed, so the little you
gain by setting it to 115.2, you lose in CPU time and dropped packets.

Since when is anything Microsoft says true? Besides, I doubt that a DX2 only being clocked at 33Mhz will effect anything but performance. The fact that someone installed Windows 98 on this machine shows the general ignorance beginning PC users have about the Microsoft O/S in general. Unfortunately for this user, he probably won't even be able to read the help files to figure out why the DOS applications he will probably use won't work. And, when he needs to load the Windows CD to add a new device or software, will have to travel to his "buddys" house to make his computer work again. Surely someone building a 486 wouldn't go and spend $200.00 for Win 98.........

8 Megs works with Win 95 on a DX2, but after using this PII 450 with Win 98 for a few months, I would hate to see it on a 486.......

>
> Even with every single option added, even while using FAT 16, it doesn't
> take over 400MB of space. Also, if the buyer is only wanting to print up
> some flyers, an older machine would do fine and save the guy some money.

Unless he has a simi modern hard disk, and downloads the special boot sector installer from the manufacture, the 486 will likely only see 540 mb of disk space regardless of the physical disk size. Unless the BIOS supports LBA (which I doubt being as old as a 33Mhz DX2). Even third party IDE cards which are suppose to support this feature have drivers that are not always compatible with Win 95-98. And....some drive manufactures applications that install this special disk access feature don't work with Win 95, and also not necesseraly "seeing" the complete size of the hard disk once installed. Case in fact, try to get Maxiblast to work with Award BIOS on a VLB IDE card 486 machine.

Not trying to put the 486 down, it's a helleva nice machine. Just pointing out the one of a thousand things that can go wrong installing Win 95/98.

Saving money? Would you walk through a bed of hot coals, swim across the Nile, and climb Mt. Everest just to see Windows 95 boot on your screen? That's about the size of it.......

I think Dennis's point was that possibly using a TOS based machine was much
simpler, and required far less resources.

Where do you want to go today?
TOS
MiNT
MagiC
Geneva
Dolman

I've already bought my ticket.

Okay, first of all-thanks to Jo, Martin, and Mike for their
excellant suggestions about using Imagecopy to convert JPG
pics for use with the Thing desktop (as backgrounds). They
worked, I just have one more teensy question. When I view
a JPEG thats as big as my screen, and I copy it, it does not
copy the full size. The window bars are left out (which is
good, I didn't want them in the pic), but the size of the saved
picture is smaller by that (window bar size) amount. So when
I use it as a background pic with Thing, its tiled, and I wind
up with a nearly full screen pic with a small border along the
lower and right hand sides...Any way to save an entire picture
or turn the window bars off while copying? Thanks again! ;-)

I would like to know if any of you guys have synced the 1040stf with the VS880 or Original ADAT. I currently have Hybrid Arts Edittrack and can sync via the sync track on the VS....of course it is the master.

I would need a program with MTC or SMPTE to sync the VS as slave, and to sync the ADAT as master. Or as far as I can see with minimal research thus far. How is Cubase 3.0 and up? If I can transmitt MTC, I should be able to read from the ADAT via the JLCooper Datasync2, a unit that I do have.

Thanks,
Dwight Sirls

Switch to fullscreen-mode by pressing ESC (IIRC) and copy the image.

Whats the best Direct to Disk recording package for the Atari Falcon
(commercial or shareware)?
Ideally I'd like to be able to use the Falcon in a vaguely similar way
to a 4-track Portastudio - i.e. record a track, add others, merge two or
more tracks into one, etc.

Any help greatly appreciated

Chris.

2737. Cab 2.5 problem

Newsgroup: comp.sys.atari.st
Date: 1999-02-11 00:00:00 UTC
From: lockwood@calcna.ab.ca
Message-ID: <79vc02$nca@ds2.acs.ucalgary.ca>
Source record: 84396

Lately I've been accessing some web pages that have long lists formatted into tables. Things like auction lists on eBay and article lists on DejaNews.

Occasionally, something will happen, and my computer will somehow switch the size of the system font to something huge, over 72 points. This renders all menu items unreadable, and puts junk all over the screen as Cab's progress bar display is updated every second or so.

I have tried various OVL's notably Dan Ackerman's and Olivier Booklage's, and it occurs with any, so I suspect that the problem has little to do with the OVL.

The problem continues even after I quit Cab, meaning that the only way out is to re-boot the computer.

This is all happening on a TT030 (4+4 megs), Magic 5.11 and Thing 1.27, with Sting 1.15 at 14.4 kB.

Any suggested remedies? A way to re-establish the proper font size would be very helpful.

Thanks,

2738. New UK Atari BBS!

Newsgroup: comp.sys.atari.st
Date: 1999-02-11 00:00:00 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <79vcrkegg1@roch.zetnet.co.uk>
Source record: 84397

Hi All!

I thought you'd like to hear about a new BBS I've discovered. Its
called the Circle BBS and is based in Northumberland. (I think!)

What with the many Atari BBSes closing recently (including the Tavern,
Meon Valley, and others) its good to see a new one! Its quite small,
and it's not on NeST etc yet, but the sysop is friendly, and he has
even released an ST game!! The board's main interest is sound MODules,
with quite a good and varied collection, including some I've never
heard before.

Because its a small BBS operating on a single line, its a Ringback
board, (for those who've never come across this means you dial the
number, let it Ring ONCE then HANG UP. Wait 20 seconds and dial again,
then you will connect normally). The sysop doesn't want to have people
ignoring this system, as he will go deaf hearing modem screeching
noises when he picks up!!! ;-)))

Anyway, enough wibble!! :-))) Below, I have posted the advert for the
board, as found on another BBS:

Hi...
Anyone that's into soundtracker MOD files, call the CIRCLE BBS
for weird, wonderful (and good) MOD's!!!
Also Atari ST software...

The BBS uses RINGBACK, so call like this:

Call the BBS and let the phone ring once, immediately HANG UP.
Wait 15-20 seconds for the BBS to be loaded.
Call the BBS again and you'll be connected.
Plese don't just call it as normal - I'll think it's a vioce call
and you'll hear "Hello?" thru your modem speaker! ;)

Phone Number: 01670-812192

Cheers,
GOR (Sysop, the Circle BBS).

Cheers!

James

Hi All!

Before I get any stupid emails, this is not about drugs, nor am I into them! ;-)

The L.S.D. packer is for executable files, and is similiar to the Happy Computer Packer.

I've never come across this program before, and I would either like to get hold of this program or, better still like to get a depacker program that uses this format.

The reason for this, is I have a game that I've found on the Net which is packed using this packer, but when I try to run it, it crashes during the depacking process. I think its because I'm running on a Falcon, which is known to be incompatible with certain packer formats.

I've tried the following depackers: Mega Depack, New Depack, Naughty Depack, Multi Depack, and the Synergy Depacker, but none of these recognise the format.

Thanks for your help. BTW please reply to my email address and not to the newsgroup, as I only rarely download the thing (trying to save my phonebill!).

<graiter@SPAMLESSstarmail.com> wrote:

>Interesting question this.
>What happens with a copyright when the
>copyright holder "vanishes"?
~^~^~^

copies of work, but you actually have to have made a serious attempt to find the copyright holder which means more than calling the number on an old warentee card and discovering that the company has been out of business for 15 years.

As well, there are proposed changes to the copyright act before the lawmakers in Canada right now that will allow for the copying and distribution of copyrighted works that are "no longer commercially available". This ammendment to the copyright act is being done mostly to accomodate Libraries, Archives, and Educational Institutions. Before the law is passed libraries, archives, and schools had to own a legitimate copy of a work to make it available to the public. If the work in question was out of print then the organization was out of luck. When the law is changed it will be possible for such organizations to have copies of these works available when the original is no longer available commercially. What does this mean for computer enthusiasts? Register yourself with the government as a software archive and you can make available to the public discontinued software. Of course there are certain steps that need to be taken in order to be recognized as a legitimate archive.

As far as I know there are no such ammendments before the legislative bodies in the United States so you guys are out of luck. Of course you could always set up a webpage on an ISP in a country like Pakistan, Taiwan, or any other number of countries that do not have copyright laws and archive the software there. Or wait for the ammendments to the law her in Canada and set up an archive on a Canadian ISP.

But as you said, the chances of getting "busted" are slim to none. The worst that will likely happen is that the copyright holder, if they object to the unauthorized use of the software, will issue a "Cease and Desist" order. So then you decided if you want to comply or ignore it at your own risk.

Now as a matter of ethics, some people are very much into "the law is the law is the law". If the law says something is wrong then it is wrong, if the law says something is right then it is right. Personally I don't have any moral or ethical objections to people making available discontinued works. I'm a working musician who pays my mortgage with my royalties so I appreciate the need to protect "intellectual property" rights, but only so far. If a market has been abandoned while there is still a demand for the works then I feel people have the right to satisfy that demand themselves even if this means violating copyright law. When it comes to works I've created which for whatever reasons I no longer choose to make them commercially available I have no objections to people making illegitimate copies of that work and distributing it to others who have a demand for those works. It's not like it is costing me any real money.

One thing people have forgetten is that copyright law was not created to protect the property rights of artists. Copyright law was created to increase public access to created works. Offering limited protection of the artist's "intellectual property" was the means by which this was achieved. The orginal term of copyright protection was 26 years, after this time the work became public domain. This gave the artist a limited monopoly on their work

but ensured that the public also gained access to the work. But then something happened that the original copyright law didn't take into account, copyrighted matterials were no longer works of art but became corporate assets. Businesses had more money and more influence over the lawmakers than artists so the terms of copyright protection were extended, and each time it looked like the copyrights were about to expire the businesses pressured the government into extending the term of copyright protection. Now copyright law is "life +50" if the copyright is owned by an individual or 75 years if owned by a business. The various media companies are now pressuring governments to have it extended to an even 100 years of copyright protection. Personally I think it is rediculous that a piece of software should have a copyright that extends beyond the patent of the machine it is written to run on. I think 10 years is more than generous for software copyright given the the commercial lifespan of the average piece of software is around 5 years before it needs to be upgraded as the machine it was running on is obsolete. For other works I'd like to see the term brought down to 26 years offered by the original (and in my opinion the best) copyright law.

The original copyright law was made to encourage people to create works of art so that these works would become available to the general public. It was the public's interest that was being served by the law. Today copyright law grants ever increasing monopolies to business and denies public access to created works. It is the corporate interest that is being served.

It has never been cheaper or easier in all of human history to create or distribute works of art. People no longer need an incentive to create art as they can now afford to create simply for the sake of creation. Unfotunately we are now living in a world that rarely recognizes art and is only interested in "product".

Right now businesses are putting pressures on our legislative bodies to ever tighten their control over their products. They are already striving to create a world where consumers are not only charged money when they buy a product but are charged more money everytime they use it in the form of royalties (there's already a DVD player that does this everytime you watch a movie). You will not be able to listed to a song, watch a movie, or use a computer program without being charged for it. Now it could be that as businesses tighten their fist around their "products" we will see the public interest turn away from commercial products and towards true artists who create simply for the joy of creation. But then again who is to say that businesses simply won't find a way to make self-publishing prohibative if not illegal.

Already here in Canada there is a tax being applied to blank recording media of 50 cents per 15 minutes (this more than doubles the price of blank tapes and CDs) This tax is being applied under the guise of helping combat music piracy. The truth is this tax hurts musicians as they are not exempt from the tax. So when an independent band buys blank cassettes or CDs or DATs to distribute their work they are paying a large

tax that the big record labels are exempt from. The government says that musicians will get the money back from SOCAN, but the truth is the only people who will see any serious money from this new tax are the large labels and the mega artists like Celine Dion (which is why the new tax has been dubbed "The Celine Dion Tax" by Canadian musicians). The large record companies have been seeing some serious erosion of their profits by small indepently released albums. Even though an individual independent may not sell a lot of albums the fact that so many artists are now independently releasing their works the number of sales really adds up. This tax was created for one purpose only, so that the large recording labels can get a chunk of the sales of works by independent artists. I predict that unless the public stops blindly accepting that "the law is the law is the law" you're going to see a lot more taxes and sanctions passed that are being pushed through legislation by business to prevent independent artists from publishing their own works.

Wow! What a rant, eh? A discussion of discontinued Atari ST software that ends up with businesses corrupting the laws that were designed to protect the public interest. Only on Usenet.

You'll have to forgive me, but as a musician who makes his living from his art copyright law (especially the perversion of it) is one of my passions.

I think if we go for a complete resources hogging TTP that makes extensive use of the DSP then the Falc has just enough poke to do it.....won't ever be a background activity though......I'd expect a C2 or an AB040 or the Tempest to be able to handle it though, they might even be able to get it to do something else at the same time...

All this talk about removing disks disturbs me. I own 10 135 carts, but
rarely change them more than a few times a year. Perhaps removing the disks
is a good idea, but (ironically) removing the disks is a bad idea -- the
greatest weakness of the 135 carts is that they are not well sealed.
Removing the disk allows a slight chance a speck of dust will get into the
mechanism. When that happens, bye-bye cart.

It is possible to load TOS 2.6 as a prg from the auto folder. I know,because
I have an official version of it from Atari,on disk. It is bug free.
It was given to me by my brother who was the Editor of ST Review. If any one
remembers Tony Kaye.He donated all his Atari gear to me after the mag
closed.

If anyone could tell me the copyright situation,then I would consider
releasing it to my friend's website for download.

2748. RF Modulator

Newsgroup: comp.sys.atari.st
Date: 1999-02-11 00:00:00 UTC
From: Andy Blakely <andy.blakely@pnl.gov>
Message-ID: <36C36280.ABA559ED@pnl.gov>
Source record: 84407

I recently bought an Atari STE which has an RF modulator. Can anybody tell me how to use it, as I'm thinking it might not work. I tried using an RCA cable to connect it to my VCR's video in jack. My digital camera works this way, so I figured the Atari would, too.

Is there something special I need to do in order to use it?

Thanks,
Andy Blakely

2749. ICD AdSCSI Card

2753. NVDI 5.01/Font Characters

Newsgroup: comp.sys.atari.st
Date: 1999-02-11 00:00:00 UTC
From: jimcoile@nwlink.com
Message-ID: <36c39c4c@news.nwlink.com>
Source record: 84412

Hi all,

I recently upgraded to NVDI 5.01 and MagiC 6. Thanks to those who helped with my earlier printing problem - MagiC 6 solved that nicely. My latest problem is this: the @ character and the " character have switched places on my Falcon's keyboard layout. This seems to apply to all fonts selected. Also,when I type shift 3, now have the symbol for pound sterling.(not the usual tic tac toe symbol - don't know the character's actual name). Is this a NVDI problem or what? Grateful for anyones thoughts on this mystery.

Thanks,

Jim

You need an RF switchbox (the GAME/TV box like on the old 2600). The switchbox has an RCA input for the line from the computer, and some connection (antenna/cable) for the tv side.

I am using the clear mono SM125. And missing Atari after 7 years is why I dug
out my ST.

>
>Now I'm sitting in front of Macs with more than 300 MHz and possibilities I
>never dreamed of. Just now and then I think of em good old times...

I am sitting in front of my ST doing things and seeing things I never dreamed
of. 2 weeks after buying my ST the another salesman for the store I bought
my computer from said the ST and Atari were dead. That was 1986:-). Who would
think that 14 years later there would still be Atari Dealers, Developers and
users of the Original ST let alone all the newer Clones. Somewhere in the
middle of this are the TT/Falcons:-).

>
>But tell me, followers of Atari... Is it worth to have all the trouble

>guess there really are enough emulators around for any platform...

There are Magic Mac users and Magic PC users. And others as well. But really
you can use any computer and OS you want and do what you want, but when it
comes right down to it, it is this newsgroup and the people in it that make
it special. They do "keep on keepin on" even after 100,000s have already left

many many many years ago. They stay because they want to stay. Since I returned to Atari, I see many posts with users who decided to return after a long hiatus.
>
>So... what's the reason to keep a Falcon or a TT besides to have it as a
>memory for them times? ... I'd *love* to still have my ST, but I sold it
>back then...

Keeping a Falcon, heck I just bought one 6 months ago. After hanging around here for a bit, I decided it was a good cheap purchase. As for "*love* to still have my ST.". Its not that hard to have one. Break the bank, spend $40. and get back into it. Heck spend $60 and get a hd.

I can tell you that when you install a 1. 2. or 10GIG hard drive, you are not going to waste over half a gig on the OS.
Magic makes your ST faster than it operated with TOS. It also corrects many flaws/bugs/ommissions of TOS. Besides this it Multi Tasks.

Mint, runs TOS and Mint programs. It has its own cast and crew and I hope to join as soon as Q makes it easy to install.

Currently I run Geneva on My Falcon.

Really these computers are just fun. This is what it is all about. Doing stuff having fun and not being a slave to MS.

Now if you want to run Linux on a PC,. Thats fine, but lets face it, there you are in the minority just like Atari Users are no matter what they run.

If you have a Mac, well then your world is fullfilled and everything is fine. Of course you miss out on the fun of bashing the only person who will speak out for mac on comp.sys.atari.advocacy:-).

I haven't swapped computers for 14 years, I guess I am in no rush to change. Each year software comes out, it generally should run on the ST and the Falcon. And quite often I can talk to the authors of the program.

Finally, we get to see all heads at work as Mint/Magic flames fly and Atari schisms to their own future. Really you can run all the OSes so its no big deal . The only problem I ahve with ASH is how they try to tie everything to Magic. But its their business, let them do what they want. They still support Atari which is fine by me.

>
>*shrug*

What colour would you like your IMac:-).

Double shrug. Welcome back to your roots. Welcome home.

Yes. A standard Falcon can play mp2-files via the dsp, unfortunately I
can't remember the title of the player...

Mp3 is harder, you need atleast a 40MHz 040 to do this ATM (mpg123).
However, a more optimised version is being worked on, and it looks
like there has been some progress lately. But don't hold your
breath...

I haven't checked out these news groups for quite a while and decided to wade through them tonight
and it kind of rekindled my atariphilia of old. My still occasionally used Mega 4 smiles as I write
this<G>
I have about 70 disks of old Atari programs from Antic, St-express, the MAST (Minnesota Area ST)
archive, SW libraries, cover disks etc. Are these still of any interest to anyone? I'm not talking
money here, I'll make arrangements to upload to either a USENET group or will post them on the W3
if anyone is interested (if I can keep my PC from devouring them or get ambitious enough to find my
old 14.4 and reconnect it to the mega). Anyone interested, are these ancient ST programs still
needed? Are their still Atari archives? I'd also consider trying to e-mail them to someone who is
willing to redistribute them to the /|\ community.
E-mail me directly as I don't often read these groups (my Mega does what I want it to and the PC
picks up the slack!)

Go into the "About" menu item in CAB and ensure that the info box reports
the version number etc of the overlay you have installed.

Check in the proxys/servers section of CAB that it's picked up the proxy
server for Freeserve

Some distributions of CAB1.5 don't work properly with CAB.OVL ISTR.

If all this is OK see if you can get any other client to work - NEWSie etc.

The problem is copyright. Although these programs are old, they are also
still under copyright. You have no right to upload them anywhere. You
can give away or sell the originals though.

Interesting question this.
What happens with a copyright when the
copyright holder "vanishes"?

If the holder is a deceased company, which is
the normal, it will have no heirs I suppose?

Even if this extinct imaginary company,
without heirs would still be the legal holder
of a certain copyright, what could possibly
happen to someone who breached the copyright?

There would be no one to sue you, no one to
claim rights, no one to compensate.

Seems like a pretty un-riscy business to me?

MG

>
>I think this is possible.

Follow up to this, I just tried it:

Display picture you want, then right click to get the picture info/edit box up, select VIEW - Full Screen, you now get your picture on screen, not in a Window. Now press ALT & HELP together, you get little pointy hand, now right click a couple of times to get a dialog box and you can now save the picture with a default or new name. I just tried it and the saved picture has the same dimensions as my normal screen (816 X 624).

BTW, the pointy hand is for drawing a defined area, but that's not needed here is it?

I think you're going to be limited to whatever screen dimensions you run in, but unless your picture exceeds this you should be okay. If it exceeds it you wouldn't see it normally as a background picture anyway!

I have the same screen dimensions for both 16 and 256 colours, and almost identical Thing set-ups. I can't get TC dimensions to be as large because of the flickering etc, but as I rarely use TC anyway, it's no great problem.

Imagecopy is one of the few programs I occasionally run in TC though!

Kind regards

Interesting, but I'm afraid it has been discussed many, many times.

> If the holder is a deceased company, which is
> the normal, it will have no heirs I suppose?
>

A company can close down, but it's intellectual property, including
copyrights, never disappear. Either the company is bought up by another
company, or it is liquidated and what's left of it goes to it's
creditors (banks or suppliers). In the case of an an individual person,
the rights go the person's inheritors.

What I mean is that the copyright always belongs to someone. Whether
they care, or even know about it is another question altogether.

> Even if this extinct imaginary company,
> without heirs would still be the legal holder
> of a certain copyright, what could possibly
> happen to someone who breached the copyright?

Of course, the question of "I know it's illegal but nobody cares" is
another issue totally. It's up to you to take the risk. Nobody cares if
you drive through a red light at midnight if there's no other vehicle
around, but if you get caught you can't complain.

>
> There would be no one to sue you, no one to
> claim rights, no one to compensate.

Wrong. The ISDA has started closing down many "emulation" sites, in the
name of companies they represent. This organization is funded by
software companies to defend their rights. IMHO it's rather silly to go

and attack "obsoleteware" sites when there are so many real warez sites around. It's probably just a matter of it being easier to deal with. The thing is, these people have the law on their side, and there's not much we can change to that.

The only way to change this would be to write to software companies and ask them to release their old software into the public domain if they wish to no longer support it. This would be a constructive move for everyone. Some companies have done this already (GFA Basic 2, STOS, 1st Word, plus lots of shareware stuff).

Hi!

My TOS 1.4 in my MEGA 4 is unfortunately burned out, because i connected them wrong :-(((
I've installed a TOS 1.0 in this computer, but the MEGA 4 don't like that TOS (neither do I) .. so I installed a program: TOSRELO 2.11...

But everything I tried my MEGA 4 crashes all the time...

Is there another way to boot the ST with a TOS.IMG file? I have here at home the TOS1.4 developpers version, but this tos is not 100% compatbible, and I have to boot it from a disk... and that is rather slow too ofcoz.

Please send your reaction in email (tos@atari.demon.nl)

Thanx,
Marius

Source record: 84422

I do not want to start a holy war here, but the original topic was
about putting "cover disks" on a ftp or website.

Taking the ST-Format disks as a exemple, all the apps on those disks
are freeware/shareware so there should be no problems...
Sometimes, the publishers put a "special full version" on a second
disk, these disks obviously have a copyright that belongs to someone,
somewhere. So I gues it is OK to put the coverdisks on the net, with
the exception of the "special ones"

Another point, who has the copyright ? Is it the publisher who may be
out of business or is it the programmer?

eg: ASH publishes CAB, who has the copyright? ASH or Alexander Clauss

Cheers from Belgium

Brian Van Tilborg asked on 09 Feb '99:

>if someone knows how to manually install everything, I would be
>happy to do this too. I tried a few ways with bad luck:-(.

1. Copy SPGDOS5.PRG in the AUTO folder
2. Copy all files from the FONTS folders to GEMSYS folder
3. If You don't use That's Write 3,4 or 5 or First Word Plus 4.0
delete the folder PF
4. Copy all DRIVER files to a folder called DRIVER
5. Copy OUTLINE.PRG and DRIVER.PRG to boot directory
6. Copy ASSIGN.SYS and EXTEND.SYS to boot directory
7. Reboot computer
8. Start OUTLINE PRG and install preferred fonts
9. Start DRIVERS PRG and install printer
10. Reboot computer
11. Delete all unused printerdrivers
12. Delete all unused fonts
13. Be carefull not to delete META.SYS and MEMORY.SYS
14. That's it -))

It's possible that DRIVER.PRG and OUTLINE.PRG got a ACC extension,
just rename them, they take up 200Kb RAM and once installed have
no function....

Source record: 84425

Marius asked on 11 Feb '99:

>Is there another way to boot the ST with a TOS.IMG file?

AFAIK there are two ways to boot a TOS.IMG

1. Boot it from disk, the disk has to have a loader in bootsector.
2. Boot it from diks or HD, with a small loader prg in the AUTO.

Using method one, You need to format a SS disk, with the means of a program like Ultra Virus Killer, You can create the bootsector. Just go to the option "repair disk", and select TOS BOOTSECTOR. You'll be able to boot TOS 1.0, 1.02 and 1.04. Any other TOS version is out of the question because the start address is different. Using this method you're able to boot the TOS.IMG, but it wil not be resetfast.

Using method two, You can load any TOS version up to 2.06, the loaded TOS will also be resetfast. You first need a utility that relocate TOS, this small app, will change a couple of bytes in the TOS.IMG. This has to be done, because different versions eg. 1.06 and 2.06 use different start addresses. Also if the computer has more then 1Mb, the IMG has to be patched, otherwise You'll never have more then 810Kb free...

Method two, clearly is the most interesting, You can load it from disk and HD, and it is also resetfast. If You have more then 1 MB, this is recognised.

The app You're looking for is called RELTOSBO.ZIP and probably can be found at a lot of ftp sites. If you can't locate it, just drop me a mail and I'll send You the ZIP file....

Now, all You need is a image from TOS, but that's another topic.....

Cheers from Belgium

Brian wrote on 09 Feb '99 :

>I have been going to my local dealers and cannot find any external
>CD ROMS.

A external CDR is the most expensive option, look for a second hand
SCSI-box or a Megafile 44 without the SyQuest.

Installing a CDR is simple, pop the drive in the box, connect cables,
set ID of drive, screw everything together and connect to computer
via SCSI<>DMAport adaptor.

The Megafile 44 option is a setup I used a couple of years ago,
inside the box there is a simple SCSI interface, which is good enough
for a CDR. So if you haven't got a interface yet, this is ideal...

When buying a CDR You don't have to go for the 40x speed machines,
because of the limitations of the DMA transfer, a 8x to 12x speed CDR
is the best buy here....

Source record: 84431
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I would think that the majority of the programs are either PD or SW since most of them came from a
local ST enthusiast BBS' archives and were on line for a number of years. The disks from the SW
library should also be fair game since a number of SW companies openly sold disks both here and in
Europe up until relatively recently. Also keep in mind that I'm not offering to upload Calamus,
Cubase etc (i.e, commercial sofrware), just what I assume to be PD or SW apps.
You concerns are well founded concerning the cover disks, though. That would be a murky issue. Is,
for example, trading a commercial program from, say a ST format cover disk containing KCS Omega, the
same as posting the venerable Cubase crack? I would think not, though I acknowledge that there is
probably a licensing issue involved here. I would have to consult the disks read me directly.
BTW, I should mention that I am, in no way, advocating SW piracy, eventhough none of you have
brought this up. <g>
Maybe, if I get a bit of time, I could upload a listing of the directory of each disk to this
group and we could take it on an app by app basis. I'm sure that the apps that I have are probably
of little interest to the die-hard Atari user or archivist. I just thought that they might be of
interest to those who are new to /|\ianism--those who didn't have the benefit of Hensa et al.
Although, I've since become a platform traitor, I just want to give a little bit back to /|\
community that was so supportive to me when I was still trying figure this computer thing out.
In retrospect, without the help of these news groups, I probably wouldn't be where I am now--working
as a web developer/musical content provider.
I came up through CAB, KCS etc, learning to do things the hard way--the right way, the off-hand
intuitive way. I learned to code pages pages using a primitive version CAB (is it compliant yet?),
my trusty Mega, and a unix shell account. I spent countless hours coming to grip with Uniterm and
setting up my 2400 modem, learning all the way. I even learned programming by writing
editor/librarians for my synths in Gbasic! To further date myself, I bought my first

520ST(no FM
then) with the outboard single-sided drive brand new and was hooked from the start. I never looked
back at my C-64 and SCI midi card again.
Now, I'm mired in the PC/Intel/Windows/Mac world (you have to make a living<g>) and can't help but
wonder if it wouldn't be a better world if Bill Gates' father had ponied up the cash for an ST for
his son! Everyone keeps saying that Gates made his fortune by making a PC emulate a Mac. This is
patently wrong! Windows owes more to Neodesk than anyone will admit. Everyone here knows that it
took several revisions of the apple OS to even come close to ND! Things like shortcuts and desktop
images immediately come to mind. It took Apple forever to incorporate such things into their
operating system!
The Atari--the little engine that could, but which everyone but the users ignored. Tramiel made his
cut and left the users to fend for themselves...Pity, when I bought my first ST, I thought that I'd
seen the future of PC's.

Message-ID: <36c4ac99.13356722@news.goldengate.net>
Source record: 84432

I'm using PacifiST on my PC and am having no problems. I did a search via altavista for the TOS
(2.04?) Image and easily found it. It even allows me to load Cubase and KCS (music sequencers) and
easily convert the songs into a standard .mid format to re-import to the PC,. I can't play them back
under the emulator but it sure beats disk swapping between machines!
BTW...your first mistake was to get rid of your Atari! My Mega lords over the two PCs that I own. I
seem to find myself endlessly transfering and adapting files between the two machines. As a musician, I have 10 years of sequences formated for the Atari/KCS/Cubase. Had I trashed my ST after
buying my PC's, you'd probably hear me in this news group whining on how I could import/transport my
program specific files, Instead, I have both machines and migration is easy,
I have to ask again, why didn't you keep the /|\? Emulators are great, mind you, but they are merely
DOS emulaters. The ST takes up a very little footprint (the mega even less) on a desktop. Why
didn't you keep both?

Jim - according to others that have upgraded to MagiC 6 there seems to be a keyboard mapping problem. Dan Ackerman has a fix (at least for some of the problems) on his web page http://www.netset.com/~baldrick. I am sure others with MagiC 6 will be here soon with more information.

Check all your settings - see what happens if you shut down and start
again, switch virtual memory on or off, etc.

I have come across that "out of memory" error once - have no idea what
caused it, but MM 2.1.5 and OS 8.5.1 worked ok for me both before that
occasion and since.

Yes, this is a CAB fault, Frank, and, I'm afraid, there is NO remedy
:-(

CAB writes long URLs to a buffer which is too short, without checking,
and other system data is overwritten. I gather it will be corrected in
a later release. You could try the CAB 2.7 demo from the ASH site
although I'm not sure whether this is the magic version which clears
the problem.

Sounds like the problem is the KEYTABLS.SYS file which is supplied
with your MagiC 6.

You can get a fix version from http://www.netset.com/~baldrick/
If you are already using this version try using the one supplied with
MagiC 6.

Gordy.

As a guess, If it's an RF RCA out, it should go to an adaptor (RCA to F)
then to TV F connector (RF in). RCA connectors (on the whole) are usually
used for VIDEO (in/out).

You can't boot the machine with only a TOS.IMG and no ROMs at all.

There are programs that allow you to boot a TOS.IMG, but the machine
still needs a ROM, at least to boot up and go and read the disk. The
first ST's with no ROM TOS still had a bootstrap ROM to do this.

Yes, AudioTracker and HDDRIVER are no problem. For applications on the
Falcon where high data transfer rates are required you profit from
HDDRIVER anyway since HDDRIVER offers higher Falcon SCSI transfers
speeds than most other drivers. The difference can be 50% if small
blocks are transferred. This can easily be verified with the demo
version of HDDRIVER and software like SCSITOOL that provides functions
for speed measurement for small and large blocks of data.

If that's the case, then no problem. Other than most shareware/freeware
stuff is already available on the main Atari FTP sites. Uploading lots
of files would be no fun for the administrator if you haven't already
checked in each archive that the file isn't already there.

There is also some PD stuff for which the authors have authorized
specifically PD libraries as the only legal distribution media, opten
because the prgrams were written before the Internet was even heard of.

It's an RF antenna connection, not an S-Video connector. You need a
cable with an RCA jack on one end, and a standard antenna connector on
the other end. On some TV's you have to tune to a particular channel to
pick up the image.

This is described in the Quick FAQ

Keep admiring its great shape!!

I have a Amstrong 600 series amplifier. 25 years old now.
The black one with the silvery knobs. I dont use it anymore. A little
unknown thingy got wrong.

I consider it as a work of art.

Cheers ;-)
Henk

I have that program, but it doesnt optimize, it gives only a very good and very detailed overview of what your program is
consuming. I use it quite
a lot.

:). If it is like PC cards installed in a Mac, not long. Once my DOS on Mac card is running, I can hotkey back and forth between the O/S'es. They don't really give a lot of detail. I was more looking at it as a replacement for my Quadra 840 40Mhz 040. A 486 would do as the host body, Mac O/S 7.5 would be enough to get MagiC running. On the 040 Mac, MagiC Mac performs quite well. I would think that running on the 060 would be pretty cool (especially since I haven't had any luck yet getting my Falcon 060 running.....)

Mike

Again, this is in the Quick FAQ.

You can connect an Atari HD directly, like the Megafile or SH drives.
Otherwise, you need either a SCSI host adapter to connect to this port,
or an internal IDE board to fit a (preferably 2.5") drive internally.

Brian Van Tilborg wrote on 0 Feb '99:

>>I am now focussing on CD ROMS, COLOUR SCANNERS and ADSCI ADAPTERS.
Scanners:

Instead of going after a color scanner, what you have to do first is find a
scanner driver. Not all scanners are supported so it would be a pity
when you buy a scanner and can't use it because of the lack of a driver.

AFAIK these drivers are available for following scanners:

GT Look : All the Epson GTxxx, including the new GT7000 model
Scan X : Microtek 330 and 360, Umax 600 and 660
NOVA/HOMA Scan 1: Mustek Paragon 600, 800 and 1200 Single Pass Scanners
NOVA/HOMA Scan 2: HP SCSI Scanners
Parx : Mustek 600,800 and 1200 Three Pass scanners
Centek : Umax scanner, I've downloaded the demo, and it doesn't work, I
think this app needs the Celine HD Driver also...

All the above are commercial drivers, and might not be easy to get hold off. In the PD
sector I know of one one program: EPSON GT GDPS, this app
is for the Epson GT scanner and works better then GT Look... I don't
know where You can get hold of it, but if You're interested I'll mail
you a copy. It works with Photoline, Calamus, OCR, Arabesque etc. Every
app which can import scans via GDPS can use the driver.
Epson Scanners are not the cheapest but they are available everywhere, and
You don't have to spend money on a driver...

Cheers from Belgium

>AFAIK 2.1.5 is the latest english version of MagicMac.

When You use the German version 6.0, you can substitute the SYS.file for
a English one. Using Ease which was included in the previous version,
You'll hardly notice that you've got a "foreign" MagicMac.
Considering that the latest version of MagicMac is already 9 months old,
it doesn't seems likely that there is going to be a English version
released.....

People that knows these things (and cares) claims than PureC generates
pretty poor code. I'm not so sure about this, but then I haven't used
it for really heavy applications either. The assembler is also a bit
bugged, but it has served me well so far. The only thing I really
don't like with PureC is that it doesn't support inline assembly.

Btw. the supplied libs really suck, if anybody still use these then
get rid of them ASAP. Oops, I still use the original AES/VDI-lib in
Taskbar...

First boot Windows (slow), then boot MacOS (argh!! This is probably
the slowest, most sluggish thing in the universe! I mean it, it really
s**ks! (the boot-process, not the entire OS (although I don't like
MacOS in general either))) and finally boot MagiCMac. Then think about
the steps every MagiC OS-call has to go through. It might be fast on
hot PCs (remember, most of the Mac's hardware will have to be
emulated/provided by Windows), but it's not exactly aesthetically
pleasing. Geeks, like me, actually care about the latter ;-)

> really give a lot of detail. I was more looking at it as a replacement for my

There are 060-kits for these Macs, perhaps that would be a better
solution?

Btw. a 486 will not suffice as a host unless you're a masochist, as
all I/O must be provided by Windows...

I know that many of my Atari friends will get up in arms and flame me for even thinking, let alone suggeasting this:

I have wanted, secretly, for many years, for some smart hacker to go through the back catalogues of the many copy-protected MIDI applications for the ST, and hack 'em so that they were `normal'.

I have a legal and paid-for NOTATOR SL, but that accursed dongle causes many problems in my 1040 so that I have to have a dozen different boot situations, depending on when I am going to use Notator, or when I am going to use Notator and print from within the program. I know that 90% of Notator's fussiness with data registry is from that dongle.

I met a musician in another city and he is using some old MIDI program which only runs off the master disk. In some strange twist, that disk is still sort of playable, on certain days, after all these years. Needless to say, he is frightened to runn the program one more time lest the disk expire and his entire back catalogue of compositions be lost forever.

From: Jan.De.Smedt@village.uunet.be
Message-ID: <7a207r$ei1$3@nickel.uunet.be>
Source record: 84472

Hi everyone,

With some friend Piloteers I use an Atari Falcon to HOTSYNC my PalmIII
with the Pilot Tools by <rodolphe.pineau@capway.com>, a Linux port.
http://www.chez.com/pilot/

We run these tools under MiNT/NAES, a LINUX-like OS.

Sadly, our desktop computer (Atari) has got a different ASCII set than
the Pilot, so when we export the addresses into a CSV file, chars above
ASCII(128) get mixed up - you know, the European special chars! - and
we would like to program a conversion tool for it.

What ASCII set does the PalmPilot use?
Is it an ISO set?
Is there a (freeware/shareware) conversion tool on ftp or www?

Greetings,
Jan

Alf Huckitt skrev i meddelandet
<36cd35fe.25193823@news.freeserve.co.uk>...

:No risk you say. and is that your excuse. there is no risk so why not
:do it.
:It is illegal. try to grasp that concept.

The roman law's backbone is the protection of property.
My first question was what if the part (company) that is to
be protected doesn't exist? Can the copyright still be
considered to be valid then? I doubt it.

The second question was derived from a brittish saying:
"Possesion is 90% of the law."

Translated to software this should mean that if I own a
piece of software I can do pretty much what I want with it.

I can, for instance, make one single file of everything,
rearrange the bits and bytes in a certain pattern (scramble
it) and give away this rearranged copy with instructions for
how to arrange everything back to original (descramble it).

Technically nothing illegal would be done.

I can also take my software to a country where there is no
copyright law (many eastern european countries) and give it
away there or from there. Again nothing illegal.

The Internet complicates matters even more.
The law has problems with exterritorial "crimes". Where is
a copied software on Internet made illegal? In the coutry
of the originating server or in the country of the
destination computer?

If I "confess" to have copied Dungeon Master several years
ago, how long after the "crime" is this punishable?

I suspect that your statement "try to grasp that concept"
is supposed to be a moral one? Maybe you should start
teaching that concept to your countrymen first? Is it not
"illegal" to steal archeological tresures from Greece and
display the loot in a museum, for instance?

Hello J�rgen,

why not give MyMail a try instead. It has more features and serves
its purpose very well considering Swedish chars. The author, Erik H�ll,
is very responsive to your needs and suggestions. Between the bugfixes. ;-)

```
I've tried the different versions of AMail and there seems to be some bugs
to sort out with the Sting version at this stage. I experienced the "Not
enough discspace" error with the first version 1.0 I think 1.01 sorted
this out but then it could not call the editor. 1.02 fixed this problem
but did not connect after leaving the editor. Now, 1.03 tries to connect
but I have not succeded in sending anything. Always fails to establish a
connection to *my* server. I'm sure it will work sometime though. ;-)
Seems that the MiNTnet version works better.
```

```
greetings, janne
```

Roger, Paul,

Thanks for the hints. I had eliminated nearly all the possibilities
the only thing remaining was Zetnet. I raised the problem with them
yesterday asking for them to check my mailbox/password. It was passed
to tech support and I managed to login tonight. :-)

No explanation, yet.

NEWSie is a nice package, credit to John, and from what I read earlier
version 0.94 sounds even better.

regards,

Peter.

Andy,

As far as I know ICD are still in business try

www.icd.com

or
ICD International
1220 Rock Street
Rockford, IL 61101
U.S.A.

Contact them to see if you can get a copy of the manual.

The card uses its own software but I also used one with
the HD Driver software.

The card I had included a clock built in which needs an AUTO program
to set the ST internal clock.

regards,

Peter

>buttons don't work.
>

It could be that the wires between mouse and plug are broken
which usually means replacment.

However on the off-chance, you could always open the mouse up
and spray a tiny amount of contact cleaner or WD40 (tm) into
the micro-switches under the mouse buttons. Use that little
red-straw they supply with evey can. Wipe off any excess
and re-build it before testing.

Small switches often oxidise when left for long periods which
stops them from working.

If you aren't sure what you are doing don't attempt it.
Don't blame me if anything goes wrong.

Peter.

PS.
Once you get it up and running, get a Zip drive to use as a
Hard disk and a copy of HD Driver to drive it. An upgraded
OS such as TOS2, Mint or Magic helps a lot.

Have fun.

> back then...
>
For me, there are several reasons why I run 100% Atari at home (I'm on a Mac
right now):

1) Cost -- Staying with my old equipment costs me nothing

2) Familiarity -- new systems require training on how to use them. I DO get
such training, but I prefer to do it at my pace.

3) Strangeness -- It's a bit interesting getting looks and comments when
I tell people I work with Ataris (e.g.: "How do you type with the
joystick?")

4) Mastery -- I can take this thing apart, reassemble it, and program in
68K assembly if I have to. I like understanding my computer. This Mac I'm
on now is a glorified typewriter.

5) Deskspace -- I have many games accumulated over the years I haven't
played yet. It seems a shame to waste them, yet I have only 2 computer
stations in my house (STe and Falcon).

6) Community -- I've known some of the people around here a long time (even if
I've never met them). Life would be a bit more lonely without them.

>does some of you have any ideer�s.

I had this problem initially with aMail as well. I finally worked
out that the temp directory it was using was in my MiNT RAM disk
which is dynamically sized. This means that it must look at the free
space available, which is zero, and complains. I just pointed it at
a path on my harddrive.

Rich.

Steve,
Well, thanks once again. I got Dan's fix last night and it solved my
problem. Obviously I misdiagnosed the source of the problem. Never had
any problems like this with MagiC in past versions. I appreciate your
help - I'm now going to mail Dan and thank him.

The switches are pretty standard. I bought 10 or 12 from Maplins and refurbished all my dud mice by exchanging the switches, cleaning everything I could and re-greasing the wheel bearings. You need a soldering iron, some solder and a solder sucker.

> will,_again_.post the ftp sites on a regular basis for the newbies.

Hallvard posts the FTP site list on a monthly basis. Latest one was last
week IIRC. Also available via FTP at:

ftp://ftp.sol.no/users/h/hallvart/atari/info/ftplist.txt

And via the web at:

http://www.geocities.com/SiliconValley/Bay/8745/atari_ftp.html

> Hensa is history

The HENSA archive has been transferred to Danny's own site at
hensa.cyberstrider.org, IIRC.

> where are the
> groovy /|\ archive sites? Post the sites,

As I said, the list is posted monthly and is mentioned in the Quick FAQ too
(http://quickfaq.atari.org).

They do subscription only now.
Last week nr. 101 was revieced here.
There was no period on it any more: so it was not issue nv/dec or
jan/feb or feb/mrt: nothing.

So when nr 102 will be printed is unknown by the makers.

They still sell all their stuff in their own special way.

^^

Hai Dennis,

Last week I was lucky.
A firm I helped tru the years with their failing Atari hardware has
given me a preset: a not-good-working-anymore GT 9000 scanner.

I found with it some disks with driver stuff for Mac and Wind
and a disk with Atari-stuff.

To analyse:
in the auto-folder: GDPSINI.prg 6290 bytes
this program say: 'GDPS kette installiert'.
Then:
SHARP300.acc 1346 b
Eject.prg 1346
GT4000_s.prg 17676 b
GT-Scan3.prg 35403 b
Scanner.prg 111052 b

Only the last one I got working: tells me its name is LookII and
gives me as far as I can see al the possibilities of this scanner.
Seems to be commercial.

And the thing is: it works okidoki OK no problem only: you need a
reset with a not-easily-observed reset-button after boot.
Why they gave it away I do not know.
I can scan even in 4800 dpi but that will be nonsense I think.
What is the REAL optical solution of this impressive big scanner?

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST
atarist@xs4all.nl

I have tried 2 16meg Ram upgrades, One has 30 pin simms the other a 72
pin simm. Both do the exact same thing. I would like to know if
anyother Falcon owners have this problem with SAM. And if the original
Atari 14meg board has problems with SAM too.
I do remember trying a demo program called SuperSam or something like
that and it didn't seem to have this problem with playing back
large samples in memory. I tried to contact the author to register it,
but never got any replies to e-mail.

>>Although I didn't work directly on the code for SAM (I dealt with the look

Well, do any of you guys have the problem I described with SAM version
1.3 or any other versions?

I'm trying to determine for sure if it is a bug in SAM or a software
conflict/hardware problem.

Thanks for any help,
phantomm@kih.net

Hmmm I already received 101 a few weeks ago... btw it looks not very nice.

For those who are interested. My little ATARI 8bit bbs is doing a little
ATARI ST support now. BBS the ATARI INSIDE. Online 22:00-08:00 (central
european time!) Full ansi, ascii, and ATASCII support. 300-19200 baud.
Running on atari 800xl +31-182-352755; it is situated in The Netherlands,

Thanx,

Marius

2862. ATARI ST NIEUWS (ACN), MABN and Stichting ST

Source record: 84305

Strange trilogie in the subject of my mail.

Actually I am an ATARI 8bit freak ... 800xl and other stuff, but here the drives of the ST hardware are still spinning. The magazine of the Stichting ST (that yellow one), still remembers me the Great Stichting Atari Gebruikers time (SAG). This magazine looks serious to me, and very steady.

MABN rulezzz the ATARI ST scene most in the Netherlands (europe?) Those folks did a very good job on my Mega STe4 and they arranged a few nice Harddisks for my old atari 8bit. It's great; they don't support atari 8bit, and all the same they were able to help me GREAT!

The most strange thing is: there WAS a REAL atari 8bit supplier in Schiedam... I'm not writing their name here, but they were the corruption itself :-(((

So: how is it possible an ATARI ST suppliers supplies the 8bit more as an 8bit supplier... hehe
---

About Atari St nieuws: hmmm it is a BIT to commercial in my point of view. Every program they are writing about is great and fantastic... where to buy it?? Yes: the ACN....
But it is nice, they are still alive: every support is better as NO support!

Hey folks,
C'ya around.
Marius

> came back have given up on Atari forever.

Maybe I'm not up on my Atari history the way I should be, but wasn't the software priacy that occured in the late 80s one of the reasons compainies moved away from the Atari platform? Was the priacy that went on back then worse for the Atari then for other platforms (I've often wondered about this)? Of course the rise of Windows and the mismanagement of Atari were probably the most important factors in its demise.

However, if piracy succeded in chasing off developers, then I would find it ironic that the argument is put forth that since these companies no longer exist, it's alright to distribute their software illegaly when it was this practice that drove them out of business to begin with.

Message-ID: <36C601B3.6EF6A8B5@mtu.edu>
Source record: 84309

Ok, I've got a question. Does the following information about the SCSI HD I have indicate that it requires the SCSI Initiator command that I've been hearing about, or is this something different?

"Note: The RZ55 & RZ56 do not have a jumper for Spin-Up Option. They require a Host Adapter that automatically issues the SCSI Spin-up Command durring Boot-Up."

Thanks,
- Mike

2867. WTB: Hard drive for 1040 STf

Newsgroup: comp.sys.atari.st

Hi all,
I just bought a 1040 STf for my son and he already loves it. Hopefully,
somebody out there has a hard drive for it that they would be willing to sell.
Please email me at:

fabiga@aol.com

It is great to see that there is still so much active interest in the ST
computers out here!!!

2868. Atari Chat with Jim Collins of Chromagic (Atari reseller USA)

To everyone who reads this....

Saturday, February 13th 8:00pm
We invite Jim Collins, Chromagic to join us to
discuss new Atari products and hardware/software
availability from the States and overseas.ï¿½ Jim is a
well respected provider of Atari goodies and
upgrades.

That's at 8pm central standard time, TONIGHT on

http://www.atariusers.com/chat

Or get there by going to...

http://www.atariusers.com/aunt

... and select "main area" in the chat menu on the left side of the
screen.

Hope to see many of you there!

Atari Users of North Texas... bringing Atari into the next century!

:Thank you,
:Thank you,
:Thank you!
:Andy Blakely
:
There is no software with the AdSCSI card, unless you mean ICD's utilities?
This card will work with any HD disk driver I've ever tried. Supra, ICD,
AHDI, HD Driver, CBHD,...
Plug the cable from your AtariCSI port into the IN port on the card.
string a SCSI ribbon cable from the card to your hard drives/CD-ROM
(red line[power] on the ribbon cable goes to pin 1 [power] on the SCSI
device.)
make sure the last physical SCSI device is terminated, set up your SCSI
ID's (your boot drive should be SCSI ID 0 - don't use SCSI ID 7) and
partition your boot disk installing the boot sector for your HD disk
driver. (i.e. ICD=icdboot.sys) and reboot.
let me know if you have any problems. you know my address! :-)

Thanks for this list. When I purchased my Falcon it came with GT LOOK II
Epson Scanner Driver. Unfortuneately the owner kept the scanner, and I
can't find the manual although it looks simple.

Is GT LOOK II Still supported?

>Scan X : Microtek 330 and 360, Umax 600 and 660
>NOVA/HOMA Scan 1: Mustek Paragon 600, 800 and 1200 Single Pass Scanners
>NOVA/HOMA Scan 2: HP SCSI Scanners
>Parx : Mustek 600,800 and 1200 Three Pass scanners
>Centek : Umax scanner, I've downloaded the demo, and it doesn't work, I
>think this app needs the Celine HD Driver also...

Question is, which one gives the best results? Homa systems is in Canada
so I would like to use their software if they support better scanners.
If it all the same, then I will use GT LOOK II.
>
>All the above are commercial drivers, and might not be easy to get hold off. In the PD
sector I kno>w of one one program: EPSON GT GDPS, this app

>app which can import scans via GDPS can use the driver.
>Epson Scanners are not the cheapest but they are available everywhere, and
>You don't have to spend money on a driver...

If this is not on the Belgian FTP site list, then why not upload it there
for everyone?
193.190.205.13

I would prefer it go to the michigan site, but Its not working for me atm.

Anyways if the file isn't too large, then I wouldn't mind it be sent email
if you cannot send it to an ftp site.

Price isn't the problem, but if I am going to spend the money, I want
as good as quality as I can get. How can a PD DRiver affect the quality?

Thanks, and I am glad to know GTLOOK II works with the latest.

He was also mentioning club disks with older pd software on them. Similar to if I had a collection of old TAF (Toronto Atari Federation Disks). Some people just want to know if there are places to upload old software. I directed him to upload some of it to the UMICH archives as most of the software there is older in nature. Which is good if you have a stock ST and never had access to this goldmine of software when your ST was the hottest compture to have:-). Ok the BEST compture to have in 1985.

Funny you say that. I was actually going to suggest you run Pacifist. THen I saw your next post and deleted the message:-). You wouldn't believe the number of people who moan after the fact that they got rid of their ST. But really its not that hard to find one if they needed to run their old stuff.

Anyways. I have a question for you. Do you know the location of the FTP site with all the .ST files. I have a ftp site about 6 months ago, then swapped around some harddisks and lost the file with ht ftp site?

At this site there were alot of files already converted in .ST saving lots of time.

Later Brian.

You got a point there. You never own the software. At least I have yet
to see a commercial software licence agrement that state that you own
the software.

What you do is, you are paying for the right to use the software.

You might own the box and the manual, and even the disk it is on,
but the software on the disk/cd is not yours.

There is one thing, what nobody mentioned here. A PAL (or NTSC) encoder.
It is only in machines fitted with RF modulator. You may connect RF
modulator output to aerial input of video, but that gives not so good
quality, and camera probably has not RF input.
Better way is using Atari's composite video output. You may find it on
13-pin video (monitor) connector on pin # 2. Audio out is on pin # 1. Only
problem may be find cable or connector for it...

They must have a licence to continue development because according to a article in the German "ST-Computer" they are working hard on TOS 5.0 and when it is finished it will be ported to.....TT and falcon

Some of the highlights:
- Glow Icons, according to Milan the most innovative and beautifull icons available on any platform today
- New window look, the bars will be smaller and have a optimized 3D look and also be more flexible....
- Thing will be the standard built in desktop
- new CPX protocol
- Long filenames
- VFAT32 compatible
- Partitions up to 127 GigaByte

Well, lets wait and see.....

Hugo

It is not finished (yet), but it is no more for sale in Belgium.
Nr 101 is the current issue. If You would like it You'll have to
take a abo...Yes they still sell soft & hardware for the Atari. If
You don't mind waiting for it 3 to 6 months. I can recommend You
MABN though.. reliable and a good service
Did You know that ACN is not the only Dutch Magazine? Stichting ST
is also available, and that's a whole different piece of cake.....

>Please can anyone help me dfragment my SCSI harddisk or format specific
>parts of disk?

You cannot 'format' specific parts of the HD but some utilities (ICD
for one) will allow you to 'Zero' a partition which effectively
deletes all the contents by clearing the FAYs and directories. You
could get the same effect by just manually deleting all the contents
using TOS.

The best defragger around ATM is HP_OPT v2.7. You will find it in
quite a few places but I know, for sure, that it is on:

AHDI and CBHD both support this card, as does Extendos. If you build it into a PC case with a SCSI-Burster it can support at least four drives, that's as amny as I had kicking around to test it with last time I had my hands on one....Had problems getting audio out of the CDROM though, but have put that down to AHDI as changing to CBHD has cvleared that up on other systems...
Metados......I never got it to work, but then I've never (yet, giving it another go right now on the STartIDE and Link2 kitted STFM next to me)

Sorry I missed the original post, but one option is to use a PC case with a SCSI-Burster. if you already have a hard-disk on the ACSI port then it is quite likely that the CDROm can share the interface, if the interface is built into the PC case as well, or else if you already have an external interface like the Link2 then you can just plug this into the Burster anyway.

Give me a mial on chrisc@zetnet.co.uk for more info...

Greetings all,

I have lately been wishing that there would be an emailer that would incorparate its own editor, and the only (non-commercial at least) I know of that has this is MyMail.

However, I believe MyMail won't work with less than 16 colours, and since I (at least for know) work only in mono, it is not possible for me to use it. Would it be possible to make a mono-rsc for MyMail, allowing it to be useable in mono-mode? Cause it look like a fine emailer, judging from screenshots I've seen.

If not, is there another emailer that have a built-in editor? (I'm getting a bit tired of working with external editors all the time, even if it does work)

Regards,

Joakim

Hallo!
Using a computer is often a mess! You often could do
the job at a shorter time without it.
But I got a surprise when I was to move a spread-sheet
from my Atari at home to the PC at work.
All the information was exactly correct when I opened
the .xls-file at work! Even the spesiel Norwegian
characters were right and the formula had changed from
German to Norwegian (Wenn -> hvis(if))!
Texel is the spread-sheet for Atari! Easy to use and
does what it shall do!
Question:
Does anybody know if it is possible to use a text as a
result of a Wenn(if)-sentense?
Example that do not work: Wenn(B3<78;"Good";"Bad")
Example that work: Wenn(B3<78;1;0)
Is it a way to go around the problem?

>result of a Wenn(if)-sentense?

Not yet, I'm sorry. Texel 2.2 (which will be - hopefully - released this month so we can do English and French translations) has a completely rewritten parser that allows me to use strings in some future version, but don't expect this to be finished before summer. (In fact the new parser already recognises strings as function parameters, but Texel cannot evaluate string yet so you'll get a #STRING error.)

bye, Thomas

Hello friend:

Yes, there is a demo of Magic c pc for earlier windows, I tried many years ago and I was able to run Page Stream. This was before Win 95 and I am quite sure it was win 3.11. I remember it was about 5 years ago or so ;)

:I met a musician in another city and he is using some old MIDI program
:which only runs off the master disk. In some strange twist, that disk
is
:still sort of playable, on certain days, after all these years.
Needless
:to say, he is frightened to runn the program one more time lest the
disk
:expire and his entire back catalogue of compositions be lost forever.

There are good and easy ways of making backup of protected disks.
Try the Blitz copier, requires two diskdrives and a special
cable, which you can make yourself.

With the Blitz copier I have only failed with one single (boring)
game thisfar. The Blitz copies the disks in analog mode, like you'd
copy music tapes.

I've heard there is a version for the 1.44Mb disks as well.

Legally you have the right to make as many copies as you like
from software you own.

Just a quick note to let everyone know that I've put a website back online and have linked up with the Atari WebRing. You can visit the page at:

http://www.cyberspy.com/~cdungeon/dungeon.htm

The website is under construction (aren't they all...grin) but online right now is a long winded message from me, a few links to other Atari sites, some files for you to download and play around with, and a listing of new & used software, accessories, video game systems & cartridges, and a few odd's and ends.

Hope to be adding more features in the very near future such as product reviews, some articles that were printed in past issues of our newsletter, The Dungeon Sojourn, and more. Even if the Dungeon doesn't re-open as a business, I'd like to keep the website up as an Atari support site.

Thanks for taking the time to read this and I hope everyone will stop by.

Good news indeed! I just didn't think it would work at all, since it is stated
on its homepage that 16 or more colours is required.
I'll check it out at once! :)

Are you a member of the former Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990?

Then you should not wait a second longer and surf over to http://www.fortysecond.net/stniccc2000 to discover that, in fact, a reunion of that very historical event is being organised for December 2000, a 10th anniversary reunion as it were! It is going to be the coolest event of the millenium, I can assure you!

Please note that the URL has changed, so if you have any bookmarks set up, please correct them. Also, a lot of picture links have been added to the gallery. If you're one to dwell on the old Atari scene, check out the many snaps!

> 1.27, with Sting 1.15 at 14.4 kB.

This is a problem with CAB under MagiC; it doesn't happen under TOS
(probably not under MiNT either). It occurs when a URL gets beyond a
certain length, and it's too much for the AES to handle trying to display
it in the info bar (making the window wider doesn't help: the problem is in
how the AES handles the long string of characters). As you get lengthy URLs
mainly when using search engines and the like, it manifests itself mainly
on these sites.

When this last came up in here, Alexander Clauss said it was a bug in MagiC
but he'd build in a workaround into later versions of CAB.

> Any suggested remedies? A way to re-establish the proper font size
> would be very helpful.

There aren't any remedies, unfortunately. If you don't re-boot the machine
will crash eventually.

> works this way, so I figured the Atari would, too.

The output from the RF modulator is what it says: Radio Frequency, ie it's for plugging into the aerial socket on a TV set, not a line level video connection. You could try plugging it into your video's aerial input, but you may find you can't get a decent picture as the ST usually operates at the same frequency as the video's RF modulator and they therefore interfere with each other (same problem with games consoles and videos interfering with each other, and Channel 5 in the UK). One option *might* be to retune the output frequency of the VCR to avoid interference (AFAIK you can't alter the frequency on the STE). NB you'll then have to re-tune your TV to get the signal from the VCR on the new frequency, and you run the risk of setting it to a channel in use by a station you want to watch.

NB this is written from a UK persective: standard frequencies for video games, VCRs, home computers etc may be different elsewhere. Also, you fiddle at your own risk!

I've had a look, some things could be better. I think they've found adelicate balance between compiler speed and object runtime
speed.
Pure C was 25% faster and produced 25% less code then the
Megamax I used before, which did not perform any optimization at all.
(And Pure C was full ANSI).

> The only thing I really
> don't like with PureC is that it doesn't support inline assembly.

You really cant expect this from a compiler that does not need LINT. :-)

> Btw. the supplied libs really suck, if anybody still use these then
> get rid of them ASAP. Oops, I still use the original AES/VDI-lib in

Yes. AES/VDI still awfully define parameterblocks global, but youreally must blame Digital Research for "inventing" this silly
interface
in the first place. They probably never heard of such a thing as a stack.

Thanks &
Greetings.
Henk.

the
>AUTO and other needed to operate DATA ?

Hi Dimi,
Take a look on my homepage - the troubleshooting section to get some
hints.
The best program for defragmenting is Diamond Edge. Another way to do it
is if you have another partition that's big enough to hold all the data.
Then you just copy everything to it, then delete everything from the
original and last you copy everything back again and violaï¿½ - the files
are nice and unbroken again since they're copied one file at a time by
the system.

Hi Chris,
If you only need the "tape recorder" functions, get AudioTracker from SoundPool (demo version is found at www.soundpool.de). If you need to have a sequencer for your midi too, get Cubase Audio. As I haven't seen a well working Logic Audio system (but a couple of crashing ones), I can't recommend it - maybe someone else knows if the last version works ok?

> I have another one: Is it possible to connect an Atari ST to a standard
> multi-sync monitor, maybe using a special device?

Yes and no! It's possible only if the monitor can sync down to the
RGB frequency of 15.7KHz horizontally. The Microvitec 1438 and NEC
(model?) can do this. Unfortunately, a "standard" multi-sync these
days usually means one which syncs to PC-style VGA frequencies.

Steve:

I fully agree. I see a lot of response to FS posts with "WHERE ARE
YOU?" However, there ARE a lot that DO mention where they are, but
mostly with people who do not want to ship, but would like a local
sale (or givaway). But as a general rule, it would nice to know
the locations as you state.

A few minutes after poasting this message I finally got an ST to use Metados. It was with version 2.74 off the Stratos 4 CD. Used a modified config.sys I already had kicking around......The drive is a Matsushita 6x SCSI one hosted via an ICD Link2. The hard-drive is a 60Mb Conner 2.5" IDE internally fitted to the STFM hosted via a Mario Becroft IDE installtaion that I sell under the name STartIDE in this country (UK). As far as aI can tell the STartIDE doens't fundemntally interfere with the ACSI host support. Also this is the first time I have got Metados to work with an Atari release of AHDI (6.06) as opposed to the SoundPool modified one (6.06U)....

You are absolutely right!! And don't forget about the different television systems too! I once bought an Atari computer in Canada, where the NTSC is common.
The seller was very honest, and told me before this could be a problem. I wanted the computer at all, so we made the deal.

So I agree with Steve Stupple!

Btw I live in The Netherlands, running BBS the ATARI Inside on 800XL, supporting most of the atari computer systems. online: 22:00-08:00 (CET!!). +31-182-352755, the bbs is completely FREE!

I don't really understand all this negative reporting about ACN. For
more than ten years I have bought almost all my software from them,
and without any real problems. Yes, sometimes it takes them some
time, but only with software that they don't have in store (which is
quite a lot recently) Other times they send you the software within
3-4 days.
Buying hardware I have only experience with my Milan, which took
two/three months, but only because the 'orignal Milan housing' was
sold out (I checked at the Milan Company also). Only very annoying
was that I had to call ACN myself to find out. As a treat they
brought me the computer the day they got it, to my home. (well,
Amsterdam isn't that far from Haarlem)

> There appears to be another "dealer/tech support" for Atari in

Hi, i recently had an atari 520st,monitor and floppy drive donated to my store.

I am wondering if anyone has an extra power supply for the 520 and the disk drive. (Drive is a SF354) they are willing to sell. Or mabye even a small HD, mabye 20-40 megs.

I imagine nobody is intersted, but i have a lot of atari 8 bit stuff i have aquired. Just in case anyone still uses atari 8 bit and has any ST stuff they would trade.

I live in Ontario, Canada

2946. Re: Connect ST to a multi-sync. monitor?

Newsgroup: comp.sys.atari.st

From: dennis.vermeire@ping.be
Message-ID: <7a788febb1@news3.Belgium.EU.net>
Source record: 84255

Instead of giving the standard answer "find a second hand monitor
who can manage 15.75Khz", Think about this for a minute....

We're a special kind of breed, yes? There is no one more inventive
in the world then a Atari user, yes?
So, lets be inventive......

Instead of hunting for a old second hand monitor which probably has
had his best years, go hunting for a EXTERNAL VGA TV TUNER.
Connect the tuner between the monitor and the ST, instead of plugging
the antenne cable in the tuner, plug in the RF cable from the ST and
voila...a low and medium resolution like you've never seen before
These external tuners don't cost really much, and a brandnew monitor
might be cheaper then a 10 years old Nec 3D. As a addional bonus you
get a televison with teletext and zapper thrown in. You can connect the
tuner to every size monitor and it even works with LCD flatscreens....

So, stop the hunt for old and outdated monitors, leave those for Amiga
users, we're the inventive & special breed, get a VGA Tuner

Cheers from Belgium

Hi Thomas,

I was recently asking System Solutions (GB distributor of Texel) about
the long awaited English translation of Texel 2.1

I gather from your above statements that the next version will be easier
to translate?

I know that the English speaking ST users are not the majority but we do
represent a critical mass so it is often a disappointment to not get
translations of Excellent packages like Texel, Artworx and many others.

When I first got my Milan I noticed that HDDriver would run in English
under TOS and German under MilanOS. It wasn't until I found the language
variable in the NAES.CNF that I found out why. I hope more software will
support features like this in the future.

regards,

Peter.

Maybe an excuse, but certainly not a valid reason IMO.

Remember software companies saying that software was expensive because of
piracy ? Did you see the price of software drop when everyone switched to
the CD-Rom media, before the arrival of CD-writers ?

>Was the priacy that went on back then
>worse for the Atari then for other platforms (I've often wondered about
>this)?

I don't think so. The difference was more in the price of software, and
companies going where tha money was.

Thanks to all for help. The mouse is working now! I don't know why, but I just tried it again and it's working fine. It may have been a dirty connection on the plug from sitting so many years. All is well now.

Andy

Hi all,

I just did a small job for a friend of mine - he needed someone to scan some maps for him for his web site, and I was more than happy to oblige, using my Falcon, my Microtek E3 scanner, and a copy of Nima's Scan-X driver software.

You can see this at http://www.guyanaca.com/features/trail_diplomacy.html . Tell me what you think about my scans (and Amral's site, Guyana and The Carribean Connections).

I'm also having some trouble getting another map scan he wants done to the right amount of brightness - it's a photocopy of a colour plate. The problem is that not only is it not bright enough, but the scan is somewhat uneven regarding brightness - loading it into Vision or GEMview and using its brightening filters makes it too bright in certain places. Any tips?

Support? Don't trust these guys. Here in Belgium we have a saying that
one can't trust Dutch businessman at all. This is certainly the very
truth for ACN. I rather would do business with the devil then with
them.

>Eject.prg 1346
>GT4000_s.prg 17676 b
>GT-Scan3.prg 35403 b
>Scanner.prg 111052 b

-GDPSINI.PRG was mainly used by CHRANACH, this program could not
access a scanner & printer with the normal GDPS app.
-SHARP300.ACC is the driver for a SHARP Scanner which only works
when used with CHRANACH.
-EJECT.PRG has probably nothing to do with a scanner, I think it's
for ejecting a SyQuest cartridge
-GT4000-s.prg is used to initialise a Epson GT4000 SCSI scanner, it should probably work
with all the GT scanners, because they all use
the same command set. If you've got the Calamus GDPS-module this app
has to be activated.
-Scanner.prg is GT LOOK 2, as you already found out. Because for a
long time there was nothing better available this was the standard
app, the reset problems You got are caused by this prog.
-GT-Scan3.prg is the best of the bunch !! in combination with a laser
printer this app turns the EPSON GTxxx into a photocopy machine. Its
fast and works faultless. It supports the Atari SLM and HP lasers.
And naturally the Epson laser printers...

>What is the REAL optical solution of this impressive big scanner?
400*800 36bit.....

I will send you the PD prog, EPSON GTxxx, works much better and costs
nothing....

As I know, only TOS 1.0 and TOS 1.4 have been distributed on bootable
floppy. Replacing probably will not work, because : no such version; it is
longer than older TOS's .
If bootability is not required, you should try with TOS loaders. With them
you may load any TOS, which support your hardware.

Yup... remember the discussion I had some time ago with Walter about them?

The only time I did business with them it went OK, but appearently this
was something exceptional: called them for a new monitor for my ST plus a
SCSI-Link, they said they got it, I arranged to go to them to pick it up,
hopped into a car, drove off to Haarlem, picked up the goods (plus paid
for it of course) and that was it. Later I learned this was very unusual
for ACN: normally you order and pay, then wait endlessly for the goods to
arrive.

There appears to be another "dealer/tech support" for Atari in Amsterdam,
Marfix, but I heard some astonishing stories about that one too...

We should be glad MABN's still around :-)

ok, i try it again

I'm the (happy ?) owner of a usrobotics modem :
sportster message plus
This modem can recieve fax and messages , when the computer is off,
very nice feature, very usefull for me, BUT

IF i can hear the messages without problem with volume button on the
modem (nice feature !), i can't retrieve received fax cause the prog
winphone is done only for pc computers, not for my falcon !

So i've tried with some terminal prog like connect95 or starcall or
coma, but nothing to do, it doesn't work

I'm looking for a solution

Sad thing : the +m commands are well documented by usrobotics, and
it's very simple to get a memory dump from the modem with memory
structure easy to retrieve, but, i'm not a programmer, and i'm not
able to do a simple prog to retrieve these */-+*/*--fax !!!

So if you have an idea .....

cordialement

The most strange thing I can remember is that I bought an ATARI portfolio, with the original package-box... The whole thing would be 20 guilders more expensive to buy, but it appears I would buy a NEW portfolio...

The box carried another serial number, was without styrofoam, and the worst of all: they had fold up the package to a VERY little one... so I paid 20 Dutch Guilders for only some PAPER!!!!

Hi

I don't know about anyone else, but I wish everyone that asks or wants to sell their Atari items would mention the area they live in. I am not the only one that has brought this point up.

I don't expect everyone to have the location in their signature file, but something like USA, Canada, Europe etc.. would do if you don't want to be specific. Even Miami USA, Scotland UK, or France etc.. would be a big help.

This would allow Atarian's that are IN your area of the world to help. I don't mind tracking down something for someone in the USA, but it will cost more in shipping costs. If people have an idea where you are, without having to ask a question, help may be more forth coming.

It would be nice to see who else echo's or agrees with me on this one.

Yes, it's possible. I use a NEC MultiSync 3D on my Mega Ste. I bought the monitor used. It came with a special cable adapter with a toggle to switch between color and hi-res monochrome. I have a second NEC 3D that I use on my TT with a Nova graphis card.

You'll need a monitor that syncs down to 15 mhz like the NEC 3D though.

Congratulations.

If you want to look in the ROM visit:
Stichting ST - de Thuishaven van Atari in Nederland
and download TTDigger.

They also may have a switcbox for a multisync monitor.

Search the web for SOZOBON C.

Cheers
Henk.

In the past I bought several articles from them, without a problem. I also could solve one little problem with a telephone call to their support line.
About "the Belgian saying that one can't trust a Dutch businessman", such a saying DOES NOT exist except in the mind of someone who has some prejudices against foreign people. Shame on you, man

There is a big store specialized in all sorts of magazines in Antwerpen (on the Melkmarkt, next to the jazzcafe "De Muze") where I buy this magazine of the ACN. I didn't buy a copy recently but I do think it still exists.

I did all this, trying to read the MiNT sources.
Downloaded gzip and tar.
Decompressed those.
I was happy I didnt get caught in a intransitive decompression sequence.
Used gzip to produce a very long named tar archive.
changed that in MINT.TAR
I own a atari because I hate typing ever the same endless commands.
than started TAR with -x MINT.TAR
: cant open : file not found.
tried -x F:\MINT.TAR (full path)
: cant open : file not found.
tried -x f:\mint.tar (after renaming the files)
and -x f:/mint.tar

ever the same reply

Is that renaming the cause?
Am I missing a environment var?

I did all this on TT4+4 with Magic 6 & Thing 1.20 on a VFAT partition.
I even used the double click option in the parameter box to get the correct filename.

What do I do wrong?

Thanks in advance
Henk

> and -x f:/mint.tar

> ever the same reply

You're missing the -f parameter to tar (dunno why Martin forgot it), so
the correct parameters for you are

tar -xf mint.tar

(or tar xf mint.tar, doesn't make a difference)

Without -f, tar doesn't now which to file to open, it then tries to use
the compiled-in default, if any (this is usually a tape device file,
which is quite useless with standard MiNT and MagiC devices, as there is
none).

Note that for passing GEMODS-style pathnames to tar (i.e. with a drive
letter followed by a colon), you also have to supply the --force-local
parameter (GNU tar), as otherwise tar will take the drive letter as a
hostname where the file resides (as specifying somehost:somefile
normally means somefile at host somehost).

So, best idea is to always give the following parameters to GNU tar:

--force-local -x -f <filename>

Ciao

Thomas

Hi Daniel,

I haven't seen the Pictures, but I can imagine what the Problem is.
You need Software with a lookup-table-function.
Just making a pic brighter or giving more contrast doesn't make good pics.
I usually use Calamus SL with its picture-processing-functions (especially
the FrankLin-module makes this work easy. I think you should try out a
lookup-curve that looks like a 'S'

old curve:
--
--
--
--
--
--
--
--
--
--

new curve:

Doing a screengrab to rotate a JPEG isn't very elegant. Use the TOS
binaries of The Independent JPEG Group:

http://www.esc.de/homes/guivol/jpeg-bin/jpg6btos.zip

-flip horizontal Mirror image horizontally (left-right).
-flip vertical Mirror image vertically (top-bottom).
-rotate 90 Rotate image 90 degrees clockwise.
-rotate 180 Rotate image 180 degrees.
-rotate 270 Rotate image 270 degrees clockwise (or 90 ccw).
-transpose Transpose image (across UL-to-LR axis).
-transverse Transverse transpose (across UR-to-LL axis).

Katherine Ellis has a GEM shell (JPEGEM) for these utitlities.

What you really need, Dennis, is a full-fledged imaging program (not
for rotating, just in general). I have both TruePaint and Positive
Image (legitimate copies) that you can have for free. They won't work
properly with my TT's NOVA hardware: Positive Image is too slow and
TruePaint only runs in NOVA's 256-color mode. Both handle JPEG and
are Falcon-friendly. I have Photoline and Cranach anyway.

TruePaint and Positive Image were given to me by an ex-Atari user, so
I'm indirectly returning the favour. Let me know if you want them.

Ronald wrote on 14 Feb 99

>I can not get it working and no manual....
>Setting printer to HP and parallel and scanner on scsi after OK the
>stuff hangs. Printer is HP laserjet IIIP
I don't know, because I haven't got a laserprinter, a couple of years ago I saw it at work in a computershop connected to a Epson Laser printer and it was really fast. Maybe you have to put the printer in HPII emulation mode.
I haven't got a manual either....bought it from ACN, after a six month wait the disk arrived, a month later the box arrived and I'm still waiting for the manual (nearly six years now).. but I'm in the wrong thread here.... see other posting -)))

>I cannot find 'Cluts' (Kennlinien) as in GT Look II.
>If I need it is another question.
GT Look is a "standalone" app, while the EPSON GT app is more or less more suited to work from within a program. I normally use Photoline, once the picture is scanned, I can "retouche" it straight away. This should work with Chranach Studio also.

The Epson GTxxx Scanners normally give pictures with a saturated blue color hue, with the right CLUT file this is easily corrected.
If You're gonna print the pictures on a color printer, the contrast is way to high.. overal values : Contrast -30%, brightness +15%, the scan will not look very nice on the screen but once printed ... beautifull.
If the contrast/brightness and color saturation of a picture is not right, when printing you'll get a ugly dithering....
There's no general rule here...just experiment-))))

Cheers from Belgium

Dennis

Martin Byttebier wrote on 14 feb '99 :

>That's your experience but I know lots of people who are ripped off by
>ACN.
So do I, at a given time we've put together a "blackbook" against ACN.
In the local atariclub in Gent I know personally of more then 15 people
who got ripped off one way or the other by ACN.
Some highlights:

- 1040 STE without ROMS (problem never solved)
- MEGA 4, no keyboard and only 2Mb RAM (problem never solved)
- MEGA STE, without DMA, cache , memory (problem never solved)
- Gemulator Card with illegal copied TOS EPROMS (prob never solved)
- CALAMUS SL, Only the box arrived, no disks or manual (solved)
- Atari Jaguar, American version with American power supply (solved)
- ASH software, no manuals, no registration cards (never solved)
- PAPYRUS, illegal copies (never solved)
- RAM upgrades, faulty chips & SIMMS (sometimes solved)
etc etc......

A couple of years ago, they sold the remaining stocks of ATARI BENELUX,
I can't recall ANYONE who bought something and didn't have problems with
the goods supplied (in some cases they've never been supplied).
So I think Martin has put it very friendly in his posting. I'm just
amazed that a company with a record like ACN is still in business after
11 years.
Sometimes they have scoops, like reviewing a program that doesn't exists,
and naturally selling it...
They've been on a couple of Atari shows in Germany and France flogging of
their stuff. Just ask around in the newsgroups..... Horrorstories !!!!

>the Belgian saying that one can't trust a Dutch businessman"
>does exist here in West Vlaanderen. Ask every West Vlaming and he will >tell you the same.
Here in Oost Vlaanderen it exists also, and we're a little bit nearer to
the Dutch border-))). It's got nothing to do with racism or hate, in the
previous century a lot of Dutch merchants, came to the Flanders flogging
off cheap and unreliable goods on the lokal markets. By the time that the
people realised they were cheated, the merchants were gone.... that's
where the saying comes from. Unfortunatly it is still true today in some
cases...and ACN is one of them.

Cheers from Belgium

Dennis

I am Dutch to, but I am afraid I can understand the Belgium saying. We dutch do not give a very good impression to other countries. There are a lot of sayings with 'Dutch' in America and none of them is very flattering. (Dutch uncle, Dutch threath, Dutch party (what we call an American party) and so on. And I know you have to be carefull with ACN. I always try to get something somewhere else, before I go to them. (I did not go to them for a couple of years. Till know I could get my stuff from MABN.) But they are not the only people. I remember of a company where I sold a monitor. It was a company where they sold mostly windows stuff. But they assured me I could use the monitor with the switchbox I bought. It did not. I had to cahnge it for another one and to pay fl. 250,- more. When I got there, they said they had tested it intensly. When I said that I brought my ST and wanted to test it, they became mad, because they already did it. But I insisted. They agreed, but had to wait severall hours before it was possible. When I tested it, it did not work. (Or you must like to have to screen-images beside eachother.) They even did not apologize. I did get my money back. But this took almost two years. So there is a reason to be carefull with Dutch businessman. But I am also glad to say, that not everyone is like that.

Cecil Westerhoff.

> multi-sync monitor, maybe using a special device?

What do you call a "standard" multisync monitor. If you mean a standard
VGA, then it'll be a monochrome display only for ST-high res. If you
mean a "real" multisync, capable of syncing down to the ST's colour
resolutions, then there's a link in the Quick FAQ for you.

I've got both parts (A-G and H-Z) of a French Publication called "La Bible des Pokes" which was published in November 1992 by Joystick magazine. Each half has glossy magazine-type covers and contains 81 pages (162 sides) of A4, covered with pokes and solutions for an *enormous* range of Amstrad CPC, Commodore C64, Atari, Commodore Amiga and PC games.

I estimate there are about 700 pokes or solutions in each volume. 'Course, you'll need to read French for some of the solutions, but a poke's a poke, right?!

Anyone like to make me an offer for them?

E-mails to brian@spheroid.demon.co.uk please.

I can't believe that no one is looking for a TT -> I can give you such
as deal.
DON'T PASS THIS ONE UP!!! All you have to do is come and pick it
up!!!

TT FOR SALE!!!

Atari TT with internal HD (40 Meg.? I think). It comes with the color
monitor, PTC1426 and 8 Megs. of RAM (4ST, 4TT) and an external
hard drive which I believe is 400 Meg.

With loads of ST and TT software.
I also have a Migraph Hand scanner which can be used with an ST or TT.

All for $450 or Best Offer!!!

I'd like to try to sell locally first - I live in the western suburbs of

Chicago.

Chuck

I get photos put on a disk when Iget my film done. On this disk there is a small file that the ibm software uses to display the photo the rightway.

I use Photocopy4.0 to view with, I've tried saving an image after I've got it right on screen, but it is still saved the same way as it comes from the disk. Is there ANY software that I can use, that after I have got the image of the screen rightside up and facing the right way, will then SAVE it as it appers on screen?

From: b_helling@hotmail.com
Message-ID: <36c91379.79923431@news.igs.net>
Source record: 84164

Advice please.....

dead 1040stfm, supposedly ok, in storage for years... now inert.
Power supply appears good, light on kb comes up, cycling the reset
button rapidly will get the FD to turn, but not seek...
No monitor signal, activity, beep or anything.
All chips firmly re-seated..
no hot memory chips
voltage at power supply 5 and 12 +- 2%

What's left ??
The only thing I can think of doing is burning new rom chips...
Now... are these regular eproms?? I keep hearing about GAL chips...
I can burn regular 27xxx eproms, no problem...

I will worry about finding the rom .bin files that I am not supposed
to have, and no one will talk about later....

Heck, I'll settle for .bin files of whatever the thing came with..
(which should be mine, right? ---another pointless long discussion of
copyright laws across 19 jurisdictions... ---etc...)

So.. can anyone confirm that this is do-able?
advice? missives?

About 3 years ago I put together a 1040stfm with HD for a friend to
compose on... now I want one of my own...

In canada, near Detroit Mi..
Cheers.. B/H.

Failure of ROM chips is very rare, mostly occurs in case when supply
voltage is too high. So check is 5V OK, after longer power on.
Yes, these are regular EPROMS. GAL is required only if you want upgrade to
TOS 2.06.
What is about copyright of old Atari TOS's , and who owns copyright (if
there is any firm at all) is to me total unclear.

Pera

3029. TOS

Typical newbie behavior. I regularly send personal emails to people who don't realise that COM, NET and ORG domains exist _anywhere_ within this planet and mindlessly post a message along the lines of:

"Selling my ST with monitor. Best offer gets it. You pay for shipping."

Needless to say, such an ad cannot be accepted. Then again, people who join the net are never told about the basics of netiquette, which would prevent this......

I get this same problem. It is more likely to occur when using MagiC as an
OS. I think it is a problem with SAM not really accounting for memory
chunks being moved around by MagiC. It seems to expect samples to sit
in a contigious memory block...

Not sure how to get around it...maybe a complete rewrite!?! :-/

I doubt it's the ROMs. It could be just about any chip that gone faulty.
Try leaving the machine switched on for a while and then touch the
chips. If one of them is VERY HOT, then it's probably the one that's
failed. It could be anything from the video shifter to the GLUE chip,
the blitter, the 68K, the YM sound chip...

Hi Claus,

I agree with what both you and "Particle Salad" said about D2D programs.

In regards to Logic Audio Falcon, I have it running on my system pretty well. I'm using TOS 4.04 on a 14 meg Atari Falcon with Nemesis. For hd software, I'm using ICD Pro 6.5.5. I've heard that LAF doesn't seem to like HD-Driver for some reason. Haven't tried it myself, however. That could be the reason some people are having problems with LAF. I haven't tried to push it very hard, though. I've never needed to go 8 tracks at once. My biggest gripe is that you can't turn off "show waves". EVERY time you record, you have to wait for it to finish churning out the visual waveform file for the audio recording you've just finished - even if you want to abort the take and do a new one, YOU HAVE TO WAIT before you can even delete the recording you just stopped. Not conducive to a smooth recording session! The last version of LAF is 2.01. It is downloadable at:

ftp://dir.mcc.ac.uk/pub/emagic/LOGIC/UPDATES/ATARI

The site has to be accessed with an ftp client. Logic (without audio) 2.01 is also there. Both programs are the the .PRG only. You have to have all the other font, printers, etc. files and folders, and the LOG3 dongle to start with.

I would like to thank you for having some really wonderful web pages that are of much benefit to anyone doing D2D recording, regardless of what

program. Well done!

Bye,

Clayton Murray

Derryck,

all those sites have both names and numbers... Feed your ftp prg
128.214.248.6 and you'll get to ftp.funet.fi as well. Or feed it rma.ac.be
and you'll get to this belgian server...

Look at Hallvard's list, it states the IP numbers for all as well (it just
doesn't tell you 193.190.205.13 = rma.ac.be).

Usually you only remember the CORRECT name after ftp-ing somany times to a
server. Same goes for a number then :-)

I recall those people asking Q's about umich: how about the mirror sites
in the UK? Gone too? Usually this one's better/faster than the crowded
umich site, at least from over here (continental Europe).

> not use special cables other than the cable that came with it. I know
> they work because I've seen posts here before about people using Zips on
> their Atari's.

The Zip Plus is supposed to autoswitch between parallel and SCSI, but
from what I understand, this function is dependent on a cable. IOW, if
you don't use the cable that came with it, it may get confused as to
whether it is hooked to a SCSI or parallel port and not respond at all.

The solution would be to either:

(a) Use a DB-25 to HDB-50 adapter to connect it to the port on the rear
of the Falcon.

(b) Buy a DB-25 gender changer and use that to connect the original Zip
Plus DB-25 to DB-25 cable to the HDB-50 to DB-25 cable you apparently are
using now. This is the least expensive option.

(c) Sell the Zip Plus and buy a regular SCSI Zip.

BTW, unless I am mistaken, the Zip Plus has a male and female DB-25 on
the back (whereas a standard SCSI Zip like mine has two female DB-25's).
From what I have heard, the pass-thru is apparently intended for printer
pass-thru (in parallel mode), and more than a few folks have had problems
trying to operate another SCSI device "downstream" from the Zip. If that
"downstream" port is the female one, having the SCSI cable plugged in
there could also be part of the problem.

Source record: 84179

Hi everybody.

I am trying to read the mint sources.

I have just a humble TT4+4 with Magic.
I am now some 8 hours busy, and I will of course succeed.

I dont want to use tar but I have to.

I am getting very anoyed by these things.
You need gcc to compile gcc;
do you need mint to read mint?
Where is the key of this cupboard?
Well of course in a safe place: in the cupboard.

In 15 minutes I can buy a book in the nextdoor bookshop.
Now I am a full working day busy to do the same via internet,
which is supposed to behave the same as the bookshop.

This is NOT asking you how tar works.
This is only a cry from the heart.

A fed up Henk.

Hi,
If you are interested for a Falcon FastRam board,
I have one new board and I'd like to sell it for
$90 CDN$ or 60 US$.

Shipping is extra.

BTW, this board allows 4/8MB of TT Fastram for the Falcon.
It works fine with Nemesis and Nova card. It accepts a
4/8 MB 72pin SIMM. (4x8 regular non parity)

3056. Do It Archives. I just can't get the supplied password to work on any format

Newsgroup: comp.sys.atari.st
Date: 1999-02-16 00:00:00 UTC
From: martin.w6@ukonline.co.uk
Message-ID: <36c97925.643171@news.easynet.co.uk>
Source record: 84193

I downloaded both Do it for ST and Falcon ages ago. Had no problems at all with the ST version but the Falcon version all 7MEG of it just won't unzip with the supplied password. I obviously don't fancy downloading it again and I don't think they're corrupted or anything. They seem fine all files are present in the directory you just can't extract them because it always says wrong password..

Has anyone else downloaded this and done it successfully if so what was the exact configuration of the computer used?

I've tried it on ST,Falcon and PC.

The only clue I have is that the ST DOIT password is shorter than the Falcon one and perhaps this is one reason why the ST password worked. The one given for the falcon version is 15 characters long. The ST version password is only 9 characters long and works perfectly.

Is there any sort of Atari util that people might use that would cure my problem?

Does anyone know some sort of util for finding the password in zip files or even removing it without knowing the password?

I have already contacted the DOIT author and he doesn't know what the problem is?

The problem exists with all 6 doit falcon archives which rules out a corrupted zip. One or two possible but 6 no way.

I have used Winzip 6.3 for 16bit, STzip 2.4 and 2.6 and a copy of dos pkunzip (can't remember version) and also tried a small unzip.ttp program.

All zips are opened cleanly by all archivers and come up with the same wrong password error. A couple of files are unencrypted in each doit archive and they unzip without prolblems.

The DOIT version is 6.2.6 dated 16/10/98

I thought I'd do this final request for help before I just delete them from my hard drive and forget about them. Its a shame though as DOIT for ST was very good at least the english bits I can understand.

I've certainly learned my lesson with regards password protected stuff and will avoid such files in future. Mind you its still a good idea in principle I'll admit as it means the author gets to know how much interest is out there for his work. I wonder how many people have requested the password?

I'm surprised more people haven't had problems though as my systems are nothing out of the ordinary and the fact I've tried 3 completely different computers. I've typed the password in as instructed with the precise capitals as shown plus tried other variants of the password, all capticals, all lowercase etc.

They are used because some people are stuck in the past when 300 baud
modems were state of the art.

Now, we get web pages that load with a Meg's worth of useless graphics
and crappy Java programs, and the pinhead webmaster gzip's the 10k file
you actually wanted so he could "save resources".

Give me a break.

Jeff

3059. Re: ICD AdSCSI Card

Newsgroup: comp.sys.atari.st
Date: 1999-02-16 00:00:00 UTC
From: Andy Blakely <andy.blakely@pnl.gov>
Message-ID: <36C9B8FE.84F9B1B@pnl.gov>
Source record: 84196

I have the card hooked up and working on a 170mb SCSI drive, but I don't like the partitions and want to change them. There's currently 5 partitions with nearly 30mb in each one. I checked out the ICD utilities, but don't understand what the options mean, etc. I'm concerned about losing data when I (experimentally) make changes. And also, I don't know what the limits are for partitions. I wrote ICD an email requesting information on their AdSCSI card, but they're ignoring me. The ad for their card says it includes a manual, which I'm assuming is for the utility software. If I had it, I'd feel more confident about making changes. Also, would the new version of their utilities be worth the $10 they're charging for it?

Thanks,
Andy Blakely

I doubt it' still available in stores. It's still alive but only by
means of a subscription.

BTW: Where can I find the Melkmarkt? I'm not so familiar with Antwerp.
I only know the Meir.

>I'm using CAB 2.5 on a Nemesised Falcon . I believe I have the latest
>CAB.OVL file
>
Ted,

I think it's bacause of the OVL you're using. I used Dan's 1.2905 before
and this didn't happen. I got 1.3015 or something later on and found that
CAB doesn't use the cache where it should be. Annoying indeed, especially
when you try to move back one page and get another 500k of shitty
pics/banners/whatever just to click another link :-(

Dan: is it possible to rework the OVL so CAB takes a previously fetched
page straight from the cache???

I think you will find that the situation is the same all around the world.
There are plenty of shonky businesses here in Australia too, and they are
not run by Dutch people.
Unfortunately, it is always the bad traders that stand out because people
complain about them, but few people will make a noise if they have received
good service.

Having said that, traders get screwed by customers too.

Regards,

Clockmeister.

> a game with!

Impossible. Win98 setup checks the processor speed and if it's below 66Mhz
it refuses to install. Some DX2 486's have problems with win98 if doesn't
detect the actual processor speed properly, but the bus speed instead.

Win98 refuses to install on any 8Mb system, requiring at least 16Mb.

Either you mean Win95, got the 486 specs wrong or your story is BS.

>
> Now to me that is a JOKE! and all I have is 4megs ST and 4 megs
> TT. Oh they put in a 4 gabyte drive and he's only got 2ga's of
> empty room left after putting windoz onit!
>

More BS. A maximum install of Win98 is less then 400Mb. It's even unlikely
that a 486DX33 supports a 4Gb drive in BIOS, unless it has LBA support or
uses some custom disk manager software.

I think you made it all up...

Are you sure that this is the cause? I'm asking, because one time when I put
a TOS 2.06/switcher kit in my STe, I had nearly the same thing happen. I
reversed the "lo" and "hi" ROMs. This gave me a white screen when I booted
up, but nothing else. I reversed them, and all was well. Since that little
episode, I've been told by several qualified "techie" Atari types, that it
does not hurt to do this... ;-)

PS Or are you talking about some other connection?

1) Good ol Gregor didn't say anything about Copyrighted software.

2) Just because something is copyrighted doesn't mean you can't upload
it.

3) "Copyright" doesn't necessarily mean "commercial".

Give the guy a break. He's trying to help the Atari community. At
first glance, it appears that the software in question is PD.

Do you use MiNTnet? If not, then try it out and discover that CAB will unpack those .gz-files for you...

There's also idiots like me who prefer to keeps archives packed simply because it's a lot cheaper to save 75% diskspace than buying a new disk.

And when you have to archive files anyway (or would you prefer to download the MiNT-source one by one file?), why not compress them as well? I really can't see the problem here.

Even if Dennis is successful rotating a JPEG on-screen and saving it
that way, he's going to be left with a screengrab containing only 16
colors, a reflection of the current video mode (most likely TT medium
judging by the state of his Falcon). The key here is not to degrade the
image during rotation, especially one that has thousands of colors.

If you got this message, your password ist wrong, very simple.
Type in key word as shown in the key file, Watch spaces and
capital letters. Have a look to doitf030.txt, with release no
the archive are have?

>Has anyone else downloaded this and done it successfully if
>so what was the exact configuration of the computer used?

A lot depack all archive well, around the world.

>Does anyone know some sort of util for finding the password
>in zip files or even removing it without knowing the
>password?

That's piracy, and your last password of any doit-archive

Otherside, anybody, how read the .txt, have the chance to
got them all, uncrypted, on 6 hd disk, one zip or CD-R
Send media in a free back letter. That's all.
Realy simple to get the LATEST releases, allways.

Regards, Robert

> unpack those .gz-files for you...

No, I dont.
Well that is what I would have liked, so that answers the question.

But anyway, especially the atari archives use all those different types.
It wasnt only the .gz-files.

Prepare for a horrorstory!! Keep your kids away!!

Before I could even try to unpack
the mint archive, I had to download and unpack first gzip.tos,
selfextracting, so that was not too difficult.
Then I had to download tar, which was a zoo archive.
Then I had to download zoo, which I found on the umich archive.
Then my wildest nightmare became true.
Zoo was a zoo archive. ^%$@##$^@$#@^%$@
But I could see the version no. The date was pretty old.
So I found the same zoo on a old PD disc. (unpacked).
And then I lost track.
Oh no. I remember.
I unpacked tar with zoo.
I unpacked mint....tgz with gzip.
Then I tried to untar mint.tar.
But it appeared that I needed mint & mninixfs.
Which I was trying to get.

Then I got ravingly mad and cried out "COMPRESSION SUCKS!!!!"

> There's also idiots like me who prefer to keeps archives packed simply
> because it's a lot cheaper to save 75% diskspace than buying a new

That does not involve me, because you do that on your private Harddrive.

> And when you have to archive files anyway (or would you prefer to

The only thing I want to do is download a complete, compressed or not, folder and have it ready for use, untampered with, on my HD.

I dont want to unpack. It wastes my time.

A very impatient Henk.

If you don't have mint/minix, you have to use some method to preserve
the lonf file name and file structure. .tar.gz does this. If you
downloaded mint files files like Hank and hank would become the same
under tos. Or HanksHomeDir would be HANKSHOM . There really are good
reason for Compression. I use a PC for Internet. Putting a Mint file
on the PC really can screwup File specs.
> A very impatient Henk.
We've all been there. I installed mint a dozen times from the archives.
I must say, the KGMD install was very painless. If you need the
compression programs, I will post on my FTP site tomorrow. Let me know.
Also some hints for gettin KGMD to work after installation. It would
be a mirror of my system, which is very simple.

Don't try it, Andy. You CANNOT change partition sizes and retain the
data. If you really want to do this you will have to back-up the data
on the disc first.

>partitions. I wrote ICD an email requesting information on their AdSCSI card,
>but they're ignoring me.

Glad you have appeared here again. After your last msg. I managed to
dig out a xerox copy of the ICD manual from the bottom of my drawer.
e-mail me your address and I will be glad to send it. I can't be sure
where you are but it looks like mid-USA from your GMT displacement.

>Also, would the new version of their utilities
>be worth the $10 they're charging for it?

Unlikely. Wait until you know you need it before reaching into your
pocket :-)

Boy John, that stuff is going to be hard to find. You know, Atari never sold the Hotz hardware/software through the conventional dealer channel. It was only sold directly by Atari. You had to get it (I believe) from James Grunke at the Atari headquarters.

Atari later sold the rights back to Jimmy Hotz, who seems to have dropped off of the face of the earth.

Mark Friedman wrote:

>Does someone know how to get "Loops" happening in cubase Audio?
>It seems to work in the audio editor, but not on the arrange screen.

Do you mean like having the playback loop for practising purposes or recording - or do you mean loops like in drum loops?
In the first case, you just set the left and right locators to any value and then press the cycle button and start playing within the limits or start recording.
In the last case, you should set the audio track up as a RAM- or Samplertrack. Then you'll load the audio into RAM when you start the song (so you'll need 14MB) and the harddisk won't have to read the same spot hundreds of times during the song.
A RAM-track works exactly like normal audio tracks when handling them, but a Sampler track is a bit different. you have to open the Hardware setup and the Pool. Then you drag recordings from the Pool into the right window (under Segment name) in Hardware setup and change the Output of the track you want to use in the left window to the preferred type (Hard disk, RAM or Sampler). You can change which midi notes the sample should play on and when you're finished with your setup, go to the Arrange window. Now it's time to set up a midi track to control the Sampler track and you just change the Output of that Miditrack to "Sampler" and now you're free to use standard midi information on the track and you can for instance use it like a drum machine with various samples being played on various keys on your keyboard.... This way the Falcon can be used as a sampler, but the drawback is that each samplervoice will use one audio track - not so good if you need many tracks for other audio... But it may be useful for loops and special effects.

>Also, can one make multiple copies of an audio file?

The audio files can be copied in the Offline menu, by marking the Source, choosing Destination folder and then choose Copy from the functions.

The question is 'how inert'. There are levels of this.

You can measure voltages, so make a go at the pins of the CPU
(Central...).

Interesting are:
17 /halt
22 /berr

These are active low.
If the CPU when starting up finds a bus-error immediately thenthe
/halt line scahnges.
Happens it later on the /berr line wil go.

Mostly ROM's do not go wrong but is the error in the lines.

Well - lets say it this way: it took quite some time until I got it to
compile for the first time, and a bit more until it even worked :-)

AES is the worst, then VDI, GEMDOS was quite OK.

Unfortunately, Brisk software appears to be gone. :(

The address posted on both Hallvard's URL launchpad and UTSI

http://www.qni.com/~brisk/gemvelop.htm

no longer works.

Yes, it seems to have a problem with NVDI 5. Here, it prints but only
after GEMvelope terminates. For printing one or two envelopes, my normal
usage, it is usable. For printing many envelopes, I no longer use it.
Fortunately, Calamus or Papyrus handle this task quite well.

If you swap the PROMs but install each oriented correctly, you should
cause no problem.

If your do not orient one or both PROMs correctly in the socket, you will
more than likely destroy the PROMs.

The original poster wasn't clear in the original problem.

I went and installed Linux off the Floppyshop Select CD, which was advertised as having an "easy to install" Linux on it.

Well, it was medium easy, although it looks like Unix to me (long time since I've touched that), I've been told that I am actually in MiNT. How can I tell? How can I get Linux installed on my Falcon if the Select CD isn't working? Where does one find software (preferably precompiled)?

I fear that I have an interest in Linux combined with a dreadful lack of knowledge on the topic.

No, it`s not a virus.

Your right about CAB as the Crystal Atari Browser, but on the www.icab.de
site he calls it iCAB, the info-highway taxi.

Some danish Mac users drove my attention to the site, they (the Mac users) can`t seems to understand why he is making a browser and charging
Dm. 49.00 for it, when they can have IE and Netscape for free.

I don`t understand it either.
Oh,- btw. it has support for java applets. Otherwise, from the description it is the same CAB as I know it, with the same features.

cheers

Yes,- that`s what some danish Mac users say also. Why pay for a browser
when you can have netscape and IE for free.

Then again, Opera is charging for the browser?

Perhaps he is planning on a sale to the few Mac users with old Mac II or SE machines. They
didn`t have that mutch ram to play with.

This quality is reflected in the interface.Gemdos: parameters on the stack.
AES&VDI: totally insane.

Years ago I wrote for myself a fileselector as a excercise.
I decided to competely rewrite the TurboC AES/VDI libs.
This new lib had these parameterblocks completely built and passed
in local name space (auto: on the stack).
And then it worked.

Jimmy Holz I believe is HOLZ INTERACTIVE...he went on to create a
ifered light midi controller. He has a web site, I am sure if you put
in HOLZ as a word search, you'l find it.

One time I asked the same question as above, and I DID get a
response...but it was over 1000.00 (or close to it) for the system
which was way toooo much for me. Considering what the Holtz
instrument can do however, it might be worth it.

If you have the "under the keyboard" kind of mouse/joystick connectors
then the connector may need to be resoldered to the key bord. I had to
do that to my STe - the stress of years of plugging and unplugging
joysticks took their toll on it. (I think the vast majority do have the
under the keyboard type. My dad has an original 520ST without disk drive
and joystick ports on the side, but I think those were only the very
first)

James Grunke and Jimmy Hotz are both working for Hotz interactive
(http://www.hotz.com) - Grunke is President, Hotz is VP. Unfortunately,
Hotz tells me the Atari version is not available, only the Windows 95
version. I think that the likelihood of me selling off my Atari gear to
replace it with a Windows 95 sequencer is akin to me growing a large pair
of extra arms sticking out of my nostrils.

I've seen it- and it ain't pretty... the Windows 95 I mean.

: Jimmy Holz I believe is HOLZ INTERACTIVE...he went on to create a

Howdy Terry,

I just downloaded iCAB and gave it a try. It's not a bad browser for a preview. It's not like the CAB I use on my Falcon. It's a new puppy for Alex. Not having an "English" version limits my ability to set up all the bells/whistles. Basically, it's not bad. Not sure how many will pay for it, however. It has it's good points...

Friends and fellow Atari Enthusiasts:

It is my distinct pleasure to announce a new streaming Internet radio webcast dedicated to all things Atari. Back In Time ♦ The Radio Webcast has made its debut at http://www.emuclassics.com/backintime.

New episodes will be taped monthly. The show will feature news, reviews, and interviews. (Say that five times fast!) My guest for the first episode is the man STart magazine dubbed ♦The Ultimate Atarian,♦ Donald A. Thomas Jr. Don will be discussing his days at Atari, the Tramiel family, the current state of classic gaming and computing, and Nuon.

The second episode will be posted in early March. Future episodes will feature many people from Atari♦s past, including former Atari employees, hardware/software developers, etc. I will also feature the developers of current Jaguar/Lynx titles, and emulator authors that allow us to recreate the classic gaming and computing experience on the PC♦s used today. Each episode will run for about 30 minutes.

To listen to the show, you will need a PC or Mac, and a copy of the Real Audio player. The Real Audio player is a free download from Real Networks. A link to download the player can be found on the Back In Time web site.

TOS 2.06 for Atari Computers
Philip Taylor 1999

Introduction
In the early 90's Atari introduced TOS 2.06 for the Mega STE. At 256k it is double the size of the preceding versions which were 128k. It turned out that TOS 2.06 was highly compatible with the ordinary ST computer, and Atari-licensed dealers began to sell the ROM chips in kit form. For most STE computers the chips can simply be fitted in place of the older ones, however some soldering of the motherboard is needed to change jumpers. For the ST, a small daughterboard is required.

There are two main incompatibilities between TOS 2.06 and the ST(E): The Mega STE has a high-density (1.44mb) floppy disk drive with a different step rate from the double-density drives in ST(E) computers. Fortunately a small patch program in the auto folder corrects this problem.
In TOS 2.06 there is an error in the floppy disk routine for drive B. (This is of no account on the Mega STE which does not have a B drive). When you try to read a write-protected diskette in the B drive, it fails. Unfortunately the patch for this error requires a modification to the ROMs.

Soon after the release of TOS 2.06, bug reports started appearing in the German literature. One of the most serious was the 'arrow' problem viz. when you click on a window arrow or slider bar in order to move the visible part of the window, TOS redraws the window not once but twice. This is especially irksome with a DTP program like Pagestream where window re-draws are frequent and take considerable time. Patches for this bug also require modification of the ROMs. So Atari programmers began blowing their own EPROMS with all and sundry patches applied. A suite of programs called TOSPATCH can be found in many Atari FTP sites. It lists many corrections and improvements, and provides the facility to read ROMs, apply whatever patches you want, and generate image files or Motorola S-format files suitable for driving an Eprommer.

The German patches which have absolute addresses are not all in the right position for the UK version of TOS 2.06. Philip Taylor and Darryl Piper therefore devised patch files specifically for UK ROMs. These patch files (.FIL) work with the standard TOSPATCH suite of programs.

Gemulator
Gemulator 96 works well with TOS 2.06. Patching the TOS image with

TOSPATCH then testing on a PC computer is fast and easy. No more blasting eproms! Some additional changes to TOS are beneficial to running on a PC under Gemulator viz. boot directly from C: ignoring floppy drives; bypass ROM-CRC check; bypass hard disk waiting period.

xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

The following describes features of TOS new to version 2.06 - note however that some features were present in Rainbow TOS 1.06. A thorough familiarity with the fundamentals of TOS as described in the Atari "Owner's Manual" is assumed.

Boot
A memory test is conducted. This test may be aborted by pressing any key. If booting from hard disk, a shrinking black bar next counts down for one minute, waiting for the drive to get up to speed. This delay can also be aborted by pressing any key.

Drag and Drop
A datafile may be dragged and dropped onto its parent application program, whereupon the application will start up and load the datafile. For example, drag and drop a document onto its word processor: this is equivalent to starting the word processor program, then opening the document.

Copy...Date Stamp
When you copy a file by dragging it, a dialog box pops up asking for confirmation (provided Confirmation=Yes for File Copy in Menu Options-Set Preferences...). This box has additional buttons for either Preserving Time/Date or giving the new file the current time/date.

Move
Press the Control key while dragging a file in order to move rather than copy it.

Rename a file
Show Information from the File menu, then enter new name.

Copy and Rename
Press the Alternate key while dragging.

Move and Rename
Press the Alternate and Control keys while dragging.

Open Folder into a New Window
Press the Alternate key while opening it. Preserves the parent window: useful for copying/moving files up to the parent folder.

Open a Window on Drive ?
Press and hold Alternate, then the drive letter. Equivalent to double clicking a drive's icon. In conjunction with a keyboard shortcut for closing a window (see below), this method enables fast navigating among the partitions of a hard disk.

Scroll window contents
Press any cursor key. Amplify the movement by adding Shift.

Help
Press the Help key for a summary of these keyboard commands.

Undo
Stops any file operations.

Warm boot
Press simultaneously Control, Alternate and Delete.

Cold boot
Add right Shift key to the preceding. Equivalent to the reset button at rear of computer.

Deselect all Items
Press Return. Converse of Select All, which is in the File menu.

Print a text directory listing of the top window
Press > (right angle bracket) key.

Enter any ASCII Code
While holding Alternate down, press 1-3 keys on the numeric keypad. For example, to enter the letter A, press 6 followed by 5. Useful for entering special characters in the range 128-255 into word processors and DTP programs, and for entering codes 0-31 into file editors.

The Menus

Keyboard Shortcuts
A single-letter keyboard shortcut can be assigned by Desktop Configuration to any item in the menus. In the following descriptions, the author's choice of assignments is shown as an example.

File Menu

Open [O]
The usual open command. Equivalent to a double left click.

Show Information...[S]
Works for disks, folders and files. For folders, enables change of name. For files, also enables change of read/write status.

Search...[L]ocate
Firstly select the disk(s) or folder you want to search. (Else Search will operate on the active window, if any). Then invoke Search and enter a filename into the dialog box. Wildcards (*) are allowed. PT*.* will find all files beginning with PT, *.TXT will find all text files.

Delete Item...[Delete]
Deletes all selected files or folders. Some users prefer not to have a keyboard shortcut for this command owing to the danger of

inadvertent use. But for the author convenience outweighs the risk.
My choice of the Delete key is a natural one, but you need to enter
its ASCII code 127 with Alternate ï¿½ see above.

Create Folder [F]
Note that a folder's name may have a 1-3 character extension.

Close Directory [B]ack
Closes the top level of the active window: back up to the previous
level of the directory tree.

Close top window [C]
Close the active window back to and including the root directory.

Bottom to Top [W]
Swaps the bottom and top windows.

Select All Items [A]
Highlights all folders and files in the active window, including
those revealed by scrolling.

Set File Mask...[M]
Restrict the display of files in the active window by entering a
filename specification with wildcards. For example, *.DOC will show
only documents, SETTER.* shows files with the name SETTER and any
extension. The file mask is cleared as soon as you close the active
window.

Format Floppy Disk...
TOS 2.06 formats diskettes which can be read by PCs and compatibles.
The dialog box also offers a diskette Copy operation from A: to A: or
from A: to B:

View Menu

Show as Icons [I]
Show as Text [T]
It is very convenient to use the keyboard shortcuts to toggle between
these alternate views.
When Text is displayed, a small rectangle to the left of a filename
indicates a read-only file.

Sort by Name [N], Date [D], Size [Z], Type [Y], or No sort
The first two of these sorts are used the most and it is very
convenient to toggle between them with the keyboard shortcuts.

Size to Fit
When selected, this causes icons to be displayed in horizontal rows
not wider than the window. This dispenses with horizontal scrolling:
vertical scrolling may be necessary if the window is not large enough
to show all icons simultaneously.

Set Colour & Style
Choose colours and fill patterns for your desktop and windows.

Options Menu

Install Icon...
Customise your Desktop icons for Drives, the Trash can, and the Printer; and Window icons for Folders and Files. These icons are found in the resource file DESKICON.RSC, which may be edited with a program such as WERCS from HiSoft.
Desktop icons have reserved Icon Identifiers for floppy disks A & B, c for the cartridge slot, and C-P for logical drives (hard disk partitions).
File icons can be assigned to a single file, or to a type of file as determined by extension.

Install Application...
Firstly highlight the application, then click on the menu option which opens a dialog box where you can:
Link an application to data files having a specific extension. When you open (double click) such data files, they invoke the associated application, in the same way as drag & drop.
Assign any of twenty function keys F1-F10 and F11-F20 (with Shift) to an application.
Make an application Autoboot so that it starts automatically at boot time.
Choose either the application's directory or the top (active) window as the default directory when the application runs.
Choose either Full Path or File Name for parameter. Most applications use the former but where data files are stored in a fixed location assumed by the program, select File Name.

Install Devices
Installs desktop icons for all hard disk partitions, floppy drives and cartridge if fitted.

Read .INF File...
At boot time TOS reads the default desktop information file NEWDESK.INF from the root directory of the C (or A) drive.
Subsequently you can change to a different desktop environment by reading another .INF file, previously saved with the Save Desktop command and then renamed.

Desktop Configuration...
Opens a dialog box where you can:
Set the Default Directory and Input Parameter for applications in general. An application which is installed using Install Application (q.v.) has its own settings.
Scroll through function keys to see what applications are assigned to them.
Define keyboard shortcuts for menu items - see above.
See amount of available RAM.

Save Desktop
Saves settings made under the View and Option menus, Control Panel including Printer and RS232 configuration, arrangement of icons on

the desktop, open window(s) if any.

Print Screen
Equivalent to Alternate-Help. TOS 2.06 still expects a dot-matrix printer to be 9-pin Epson compatible. The print routine sends escape codes which fail on most 24-pin dor matrix and ink jet printers. To circumvent this problem, install a screen-dump program such as SCRDMP24 from Gribnif.

Organising programs
Commonly used programs may either be placed on the desktop or assigned function keys.
Put on the desktop programs which take an input file viz. a text editor, a file editor, a file viewer, word processor and so on. Then use drag and drop from any open window to start and open.
Another way to use desktop icons is to temporarily place an icon for a document you are currently working with on the desktop adjacent to the icon for your word processor. Then use drag and drop.

Assign function keys to programs which do not require an input file, e.g. a disk checker/defragmenter, floppy initialise, screen dump etc.

xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

The Atari mouse and double clicking
The Atari mouse was horrible. Atari steadfastly refused to change it from the original ST right up to the Falcon. Several vendors brought out light and responsive replacement mice, among them the "Truemouse" from Evesham Micros.
Since TOS did not utilise the right mouse button, the obvious use for it is to simulate a left double click. I have always used DC-RT-DC from Double Click Software to achieve this.

Replacement ST mice are harder to get nowadays, but a good alternative if you have a free serial port is to use a standard PC serial mouse and a program called GENMOUSE. This program allows you to configure the right button to simulate a double left click.

This package is for auction on Ebay. Current high bid is $51.00. (3 days left!)
This is a NO RESERVE auction!

Here is the link:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=67846001

Happy Bidding,

Please note this is the same auction that was up 2 months ago, the high bidder ended up backing out.

Jason

Owner/Collector of the following arcade machines:

Alcon, Cadash, Championship Sprint, Elevator Action, Gauntlet, Galaxian, Gorgar Pinball,Rastan, RoadBlasters, Super Sprint, Toobin' and Xybots.

funny you should mention this...

at last night's TAF meeting we had a demo of Mario Becroft's new
ST-to-VGA convertor, where we plugged an STe into the club's video
projection tablet, and it worked VERY well. And this one is a
no-brainer - it's a small adaptor not unlike the little plug-in
adaptors for the Falcon. Just plug into the monitor socket, plug in a
VGA cable and away you go.

<snippety snip>

Very nice manual for the new TOS! Would I have permission to put it up
with the Quick FAQ and put a link to it ?

A few suggestions, do whatever you want with them: Maybe you could
specify which jumpers need changing to install 2.06 in an STE. Also,
maybe it could be extended to TOS 2.05, 3.0x and 4.0x for which there
are only minor differences.

I'm sure that Robert will be along in a moment, but ITMT, and as far as I can make out, you should have the same password for all the current releases of the DoIt archives.

Having said that I couldn't unpack the hard drives archive with the same results as yours, something that is still unresolved.

This also occurs when trying to browse through the offline cache when
offline - you have to wait for a timeout (or have the STinG dialer loaded as
well).

>Dan: is it possible to rework the OVL so CAB takes a previously fetched
>page straight from the cache???
Echoed. I've emailed Dan about another problem where one has to either wait
for a timeout or have the dialer loaded in order to browse the offline cache
- Olivier Booklage's OVL now has a switch to force this condition.

This is a FAQ, therefore, it's in the Quick FAQ. You will only be able
to deal with ST Hi-res, no colour modes.

3141. JagFest '99 announcement

Newsgroup: comp.sys.atari.st
Date: 1999-02-18 00:00:00 UTC
From: forhan@millcomm.com
Message-ID: <BuXy2.164$986.3597@nntp1.nac.net>
Source record: 84078
Cross-posted to: rec.games.video.atari,rec.games.video.classic,alt.games.lynx,comp.sys.atari.st

I'm pleased to announce JagFest '99. The _tentative_ date and location is June 18 in Rochester, MN. I know June doesn't work for everybody, but it's the best time for me this summer and also keeps the event from conflicting in any way with CGE '99. Still, I'm open to changing it if it would dramatically improve attendance.

Details are on the below web page. Look for jagfest.atari.org to be the new link within the next two days.

http://homepage2.rconnect.com/forhan/jagfest.html

Let's get the word out! I'd like to see as many links, newsgroup posts, email newsletters, 'zines, etc. carry some reference to JagFest '99, so we can make this the biggest event yet. I wouldn't mind opening it up to Atari computer support as well, if I can get some ST groups to come in to the show. A bigger emphasis on other Atari systems from the past would be welcome as well.

Feedback is appreciated, and please be sure to send me an 'Attendee' email if you plan on attending.

Thanks,

Carl Forhan
Songbird Productions

I have the problem with just single TOS 4.04. Even getting a small
sample to play back in Sam is a problem with 14megs of useable Ram.

Anyone have a Atari original 14meg board that uses SAM?
I'd like to know if there is problems with it as well.

Also, can someone explain why the Falcon can only access 14megs?
I know you can access more with a major upgrade board. But what
exactly causes the limit with the standard Falcon?

As for a re-write of SAM. If it is a software bug. Then that would be
cool. If someone will do it. I think SAM is great except for this
sample playback problem.

Hmm, never noticed that, then again, my dialer is loaded 90 percent of the
computer running time. Been thinking about re-installing 1.2905 for this
reason, but let's just wait and see what Dan comes up with...

All those MiNT-brothers and sisters around: are you still surprised
that people stick to MagiC?

It seems that when you want to start from scratch that is nearly
impossible. All those developers from MiNT? How long are you all busy
with it? Years?
Did any new people join the group last year? And had they the same
problems and if not why not?
?

3148. MagiC on Falcon

Newsgroup: comp.sys.atari.st
Date: 1999-02-18 00:00:00 UTC
From: hassen_tos@my-dejanews.com
Message-ID: <7ai0rn$2j6$1@nnrp1.dejanews.com>
Source record: 84085

Hello again. For about six weeks now, I have been trying to get MagiC version 6 to work on my Falcon. I have a 14 MB Falcon with HDDriver 7.55. I have taken someone's advice and wiped clean my C drive and reinstalled it with no accessories at all, just my boot manager (XBoot) and Magxboot. I am still getting the same problem, in German, stating that it cannot find the off screen drivers. I was able to find the drivers ending in .osd in the GEMSYS directory. What's wrong with it?

Thanks in advance for any and all help.

sorry to all. when I wrote that URL, I was going from memory, and I got
mixed
up between Marios website address and his e-mail address.
Mario's e-mail address is: mb@tos.pl.net
but his www site address is: http://www.pl.net/~mario/
no TOS in that one I'm afraid! :-)))
sorry for the mixup!
excuse-moi

OK, forget it!

I found this in the hardware section on http://quickfaq.atari.org/ :

"Using a parallel ZIP drive on any Atari computer's parallel port is
impossible because of the lack of several signals in Atari's implementation
of the parallel port. You should use a SCSI ZIP drive.".

Didi.

And what does MiNT has to do with compression? I can't quite see how
the distribution of the kernel (beta) sources has anything to do with
the general use of MiNT.

> It seems that when you want to start from scratch that is nearly

Yes, there has been many new subscribers. And no, we have not seen any
similar rantings about compression.

Please direct all replies through E-Mail to bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I do not regularly read NewsGroups.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my Desk-Top Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can load them into your text editor or Word Processor and view them, edit them or print them out! It would make things easier if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend. Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

3165. SyQuest 88 Mb Syquest Removable

Newsgroup: comp.sys.atari.st
Date: 1999-02-19 00:00:00 UTC
From: jimsmith@zetnet.co.uk
Message-ID: <7akaaghfn1@roch.zetnet.co.uk>
Source record: 83995

Hi All,

A little while back an ex-Atari user gave me his SyQuest 88Mb removable HD plus a pile of carts - unfortunately, I have never managed to get the thing to work !
It has spent the last month at a local PC shop to be repaired but they never even got round to looking at it, so I retrieved it.

Grovel mode on;

Is anyone in the UK prepared to loan me a working mechanism (internal or external) to have a look through the carts ?
In return, I am prepared to send the carts (10) back with the SyQuest when I am done (as they will be of no use to me with nothing to use them on).

Please contact me by email if you can/are willing to help.

TIA

Jim.

PS The daft thing is that I do not know if the carts are Atari or PC formatted, so I may still be no wiser as to their contents !!

3166. DNS Query

Hi,

When trying to get to an ftp site with Newsie 94 I get the message

DNS query, can't resolve hostname

As I regularly usesd this site with v92, can someone explain to me
what this means ?
(Other sites are causing no problms, so I do not particularly want to
have to go back to an earlier version of Newsie unless I have to.)

TIA

Jim.

3167. Omikron help

Newsgroup: comp.sys.atari.st
Date: 1999-02-19 00:00:00 UTC
From: Mark Slagell <slagell@cs.iastate.edu>
Message-ID: <36CD5E40.241A9C4F@cs.iastate.edu>
Source record: 83997

Would some kind soul please compile this 1-line program using Omikron,
and email me the executable?

```
100 DEG : PRINT SIN(0)
```

I'm trying to trace down a bug in TOSBOX, but the correspondent who
found this one doesn't have the Omikron compiler, and it's a whole lot
easier for me to trace a small compiled program that exhibits a bug than
to try to monitor an interpreter.

Thanks,

-- Mark

Eh? It shouldn't do that, AFAIK the date is good until sometime in the 22nd century. The ST hardware is Millenium compliant, but its possible that some software isn't.

Maybe its the clock program or control panel program you're using. I do know that the clock setter program for Forget-Me-Clock cartridges has problems. Have you tried the latest version of the Control Panel software called X-Control?

Cheers!

James

Further to my earlier please for help on this here NG,
I am once again asking for any help that can be rendered
concerning the setting - up of STiNG (1.15) on my STE
1040 2 meg.

I downloaded the whole thing recently and although I've
taken some advice (thanks Roy), it is not connecting to
the Net at present. Almost but not quite...

Some idea of the prob:

well, the cpxs seem ok and I've set the speeds and that
but when it comes to actually running the logon sequence
with the dialer desk acc, it gets all the way through to
'connect' and then the modem lights go off and it hangs up.
Any ideas? I've tried many differnt things all with no
joy. I'm trying to get it to connect with PPP if that helps.

Any advice would be gratefully received :)

Many thanks

Al Ferrier

>(Other sites are causing no problms, so I do not particularly want to
>have to go back to an earlier version of Newsie unless I have to.)

What is the name of the site you are trying to access?

Basically, DNS is what keeps the Internet ticking when it comes to
domain/host names and IP addresses.

So, by the above message it means that the hostname you have enetered
can not be found on the internet and the destination is unreachable -
much like posting a letter to a house which does not exist.

If you send me the address you were trying to access I'll take a look
and check it out for you.

Yep, both S4T and CHROmagic should have it. I don't know if it's CAB, the
latest OVLs or MagiC 6, but surfing has never been better here. :)

>2. What scanners does the SCAN-X (or whatever it's called) software support?

Basically, the Microtek and Umax line of scanners. Using the 1220S here,
ScanX PRO works wonderful. But, check out Nima's site

http://www.magmacom.com/~nima/

for the complete list.

The rest I'll leave to others.

Hi Derek,

using Calamus SL is one way to produce bar-code labels.
Ask for the Barcode-Modul oder wait for the SL-Update in April99.

Scanning barcodes should not be so difficult, because Barcodescanners
mostly send a serial data-stream just like scancodes from your
PC-keyboard.

That's not true, and it's also not your part.

Any people got the right password for *actual* archives, as been shown on
my download site. If anybody have older archives, they shold ask me for the
right password of *older* archives. If nobody ask me for older passwords, they
got *automatically* the latest password, anytime.

It's realy hard to read the uncryped .txt file.

(What anybody can depack without ANY password)

Otherside, i pick up emails, anyday. Nobody since last 2 weeks ask me for
an older password. Also i doasn't got any response from people they
can't depack *any* archive last week. Maybee, most of them are try
to depack cryped archives with an unregisterd release of PKUNZIP, WINZIP
and some else.

Rest is what i posted last time, no more comments.

Regards, Robert

Are you asking how would you get the serial mouse kit from Mario Beecroft or are you asking how to replace a connector on the end of a mouse cable?

If it is the latter, snip the end off, strip the wires, solder them on. I can do one for you if you want.

regards

Steve

Scanning of barcodes is done with a wand scanner. There is a hardware/software package that does this. I believe that the Yolo Atari Club has a copy for sale (I know they have the hardware -- not sure about the software). Email me at e.kaljumagi1@genie.com and I'll find out more if you are interested. I believe the asking price was somewhere around $60 -- don't quote me on that though.

Thanks a lot, but unpacking the unpacking programs had succeeded.
It was the final step that failed.
I've got the impression that all those unpackers now occupy more discspace
than what I tried to unpack. ;-)

Cheers
A already getting used to the cold water Henk.

I hope I am not the last.
I hope that we can get rid of explicit compression as far as the net is concerned.
A protocol for transfering complete folders, which embeds compression invisibly
if that is needed.

Henk.

Use NVDI and a free barcode font
then use for example Papyrus to create and print.
The font(s) can be found on the web
i do not remember the exact location (i have the link saved at home).

To scan get a barcode scanner for the serial port.
I have done a test myself on my hades computer
and it works fine.

If you like to get more info send a mail to me

Could you possibly make more sense? In the first paragraph, you say
probably will not work, and in the second, you say you may load any
TOS.

No such verson of what?

what is longer than older TOS's, and is it relevant?

Let me explain what I wrote before more simply: Bootsector points to
a TOS.IMG file. Replace TOS.IMG file with another of your choice,
keeping the TOS.IMG filename. It gets copied into the exact place on
the disk. Bootsector loads it anyway.
Is there a difference between the bootsector loader, and the TOS
loaders?

Me neither, I don't believe that there is such a thing.

However it might be possible to rig something up using a PC keyboard with
scanner attached, connected to one of those PC -> Atari keyboard adaptors.

As for software, Calamus SL has a barcode module as does Didot Professional.

I've even got a program for printing barcodes for my Panasonic VCR! :-))

This has been discussed many times. I'm afraid it's a no no. You can't
connect a // Zip drive to an Atari via the // port. This is because of
Atari's incomplete implementation of the parallel port which lack some
of the lines used by I/O devices. It is really just a printer port.

You can connect a // zip through a cartridge port adapter, available
from woller in Germany. The only drawback is that it costs more than a
SCSI host adapter, and is less versatile:
http://www.woller.com/hardwar2.htm

From: Adrian Bradshaw <adrian@usanda.co.uk>
Message-ID: <7ajacf$od6$1@newnews.global.net.uk>
Source record: 84122

There are many commercial barcode readers (wands, CCDs & laser scanners) which are intended for use on dumb terminals and other non-PC devices. These invariably employ RS232 serial to achieve this. For example, Metrologic produce a wide range. Try www.metrologic.com or http://www.ryzex.com/ to seee the range.

Using the RS232 has a downside. You will have to write software to read the port. Scanners that use the keyboard input on PCs have the advantage that bacode input can be used on any commercially available software (word processors, databases etc.)

John, check the default.grp figures... perhaps Newsie shoved up the number
for CSAS too far, so now it's simply waiting for that article nr. to
appear. Could be your ISP has renumbered, I had that happening one time
over here. Read the logfile to get at the current numbers.

Hi,

best IMO is to start from KGMD (perhaps this Mint-98 stuff). It comes with
a ZOO unpacker and installs the tar and gzip ttp's. I happened to have the
tar and gzip ttp's around from the Linux bunch...
But basically, the first thing any Atarian should have is all
packers/unpackers: ZIP, ZOO, ARC, ARJ, RAR, MSA, LZH and preferrably the
TAR and GZIP bunch as well.
I'd say anyone operating an Atari without at least ZIP, LZH is driving a
car without a steering wheel :-) And believe me, there are still *many*!

I'm still using my Falcon daily for all my Internetting/computing needs, but have been out of the comp.sys.atari.st loop as of late. So, here are a couple of questions for you resident experts:

1. Is CAB 2.7 available in the US yet? (I'm a registered CAB 2.5 user who wants to upgrade)

2. What scanners does the SCAN-X (or whatever it's called) software support?

3. Is REAL AUDIO viable on the Falcon yet?

4. What about mp3?

*Ok so that was 4 questions, but who's counting? ;^)

Thanks!

It would be cool idea for you Ronald, if you'd know what the
discuss is about, before you post anything idiotic.

It has been pointed out many times, that *some* MagiC users
show hostile and stupborn attitude when things are about MiNT,
though they really have no stinking clue on the system in question.

Your posting is a very good example of such a phenomenon.

Yes, fatal-design.co.uk isn't being served any DNS - the primary
nameserver associated with tthe domain does nto exist.

Probably worth talking to someone at kaliba.net (who provided the
nameserver for fatal) about this.

> >First question in my mind is that does it support multiple channels
> >when opening pages? One feature I have waited on Atari version ...
>
> I'm not exactly sure what you mean by "multiple channels".

The ability to download simultaneously several images, frames, etc.
within a document, which is something other browsers take for granted.

On Netscape, for example, notice that images build-up simultaneously
when downloading a page. This is because images are downloaded on
separate channels, each using its own TCP request.

On CAB, we have only single-channel: first the page is downloaded, then
each image one after the other.... slllllllllllllooooooowwwwwwwwwww

Hi everybody.

This cry has NOTHING to do with mint or magic.

Concentrate on the way compression is thrown on us in respect
to the internet.

I thank everybody for helping me. Surely.

Lets keep this discussion clean: Compression as such.

I dont need compression on my harddisc.
If I say to a seller: "I only need 500M" he looks at me if I'm not knowing
where I'm talking about.

It is the ftp sides and the modems that need compression.

Thanks
Henk.

Is there an "Atari Runtime for Java"? No? Why?

iCab uses Apples Macintosh Runtime for Java (MRJ), and so it was no (or
just a small) problem to support Java applets.

Falcon owners have just about pulled their hair out trying to get
it to work right). ;-)

->It seems that when you want to start from scratch that is nearly
->impossible. All those developers from MiNT? How long are you all busy
->with it? Years?
->Did any new people join the group last year? And had they the same
->problems and if not why not?

Well, I'm not a developer (I do program scripts on my BBS-does that
count? <smile>), but I did join the Mint ranks late last year. I'm
amazed at this compression confusion. I've had .TTP software that
handles .TGZ and .TAR extensions under SingleTOS for a long time
before I ever found Mint. You don't have to have any special tools
to install Mint, just the software thats listed in the docs. The
documentation could be better, but I've also seen worse. ;-)

Because I don't want to?

I frequently download bigger archives, and I don't *want* these to be
unpacked automatically - after all, they would use up much more space on my
harddisk even if I don't need them now.

>where I'm talking about.
>
>It is the ftp sides and the modems that need compression.

First, I am using ISDN, which does not have a defined standard for
compression.

Second, why should the ftp server need to compress the files on-the-fly when
you can store compressed files from the beginning? This saves disk space on
the server, and it saves a considerable amount of CPU load on the server
(and the client too!).
I guess you don't want to upgrade your trusty old ST because it can't handle
a full speed bzip2-compressed ISDN link in realtime.

Decompressing the files after transfer is a lot easier than doing it
on-the-fly.

> Is there a difference between the bootsector loader, and the TOS
>loaders?

Yes.

The disk TOS versions that Atari made were special vcersions which were
linked to a different target code address so that they can run from RAM, and
the bootsector can only load this type of TOS.

If you want to boot a ROM-image TOS file, the loader (or a seperate
relocator, as in TOSPATCH) has to relocate it to run at the new addresses.

As far as I know, any double sided double density drive (ie not high density) will work as long as it has jumpers for selecting drive 0 or 1. The power conections and data connections are standard.

Here's an idea worth considering. Its so radical and amazing
that perhaps you haven't thought of it but if someone
contacts you by email saying they have a problem with the
password and unarchiving then perhaps you could ask them
which version of the archive they have and suggest that it
might need a different password as opposed to 'sorry no
ideas'.

Perhaps I didn't read the doc files down to the very letter
but had thought I'd given them a pretty good read and not
once did I realise you were constantly changing the
password.

I typed in the password exactly as shown obviously. Theres
no question of me not typiing the password as sent. Whether
the password I received was correct is another matter.
However both the ST and Falcon do it archives were
downloaded at the same time. Within a couple of days I'd
requested the passwords and when I got them back one worked
and one didn't.

Yes and I had 50% success myself although there may be a
percentage that never contact you if they can't unarchive it
thinking the archive is corrupt etc and can't be bothered to
download again.
>

Charming I'm only trying to get working something I spent
quite an age downloading without the knowledge before hand
that it was password encrypted. Its not like I haven't
followed your instructions they just don't work.

I wonder if the people who wrote the articles and submitted them into the public domain appreciate your decision to restrict their distribution by encrpted passwod. That said you've done a bloody good job in converting them into html and linking etc (at least the ST version). All credit to you.

However I wonder how you'd feel if I used your doit archives as a subset of some greater Atari information collection and restricted its distribution by password which only I gave out.

You have certainly abused the concept of public domain.

3231. Help with HDDriver 7 & a Toshiba 2.5" IDE???

Newsgroup: comp.sys.atari.st
Date: 1999-02-20 00:00:00 UTC
From: wvejumper@aol.com
Message-ID: <19990220160911.19228.00000639@ng93.aol.com>
Source record: 83954

I thought HDDriver 7.55 would be able to work with a Toshiba 800 meg 2.5" IDE
I'm trying to install in my Falcon, but I can't get far at all with it. I run
HDDRiver and the install program (it detects the drive sucessfully), and I set
up partitions and then write the partition data, but then when I try to do any
other function, or use the drive, it gives me the error message "No Partition
Data".
So basically, it's not working ;-(
Any clues as to why?
Thanks and email me at:
trey@deepthought.armory.com
(I don't like Junk Mail)
Btw, I also tried formatting the drive and that didn't help a bit.

3232. Re: Bravo Sierra Computers, has anyone dealt with them?

Linux *is* a Unix variant, so no surprise there. If you don't want to mess
with Unix, steer clear of Linux.

> I've been told that I am actually in MiNT.

You will be using one or the other: if you are in MiNT you aren't using
Linux. MiNT in its full form is also a Unix variant (effectively), but with
the ability to run TOS programs too. You can also run it without all the
Unix bells and whistles, eg MultiTOS.

> How can I
> tell?

If you are running MiNT you will get a message during bootup saying "Now
booting MiNT, copyright Atari Corp" or similar. I've never seen a Linux
boot.

Hello All:

I was wondering if there is a program (shareware or otherwise) that
will allow me to make another KEY DISC from another key disc.
I am asking this only because several of my atari music programs use
the key disc form of protection, so if my key disc goes out...so does
my program! (Studio 24/music mouse/"M"/Hybrid arts editrack)

My intention is not to "pirate" something, but to make a backup of the
key disc for personal use only.

So..is there a disc copying utlity that will do this?

Tim

Why is it when you move machines, they then decide to lose stuff!!! It's
always baffled me. Mind you when you transpose over to a PC, you can
lose everything (including the shirt!);)

> wants to upgrade)

Maybe. It is being advertised (just started), but I don't know if the
software has actually arrived yet.

>
> 2. What scanners does the SCAN-X (or whatever it's called) software support?

There are two versions of the scanner. One is for the Microtek E3, E6, E3+,
and E6+, the other the Umax Astra 1200, 1210, 1220. I use an E3 and it works
great, but the only scanner that Microtek seems to be selling now is the X6
-- I don't know how compatible that is with the E6.

> 3. Is REAL AUDIO viable on the Falcon yet?
Kind of. I'll let others talk about that.

> 4. What about mp3?

I don't know. I've heard rumors that the answer is yes, but a faster system
than a Falcon is required.

ATARI COMPUTING MAGAZINE #12

The latest issue of AC has just been published and subscribers should
get their copies shortly.

AC#12 includes the following:

HARDWARE REVIEWS
Centurbo II
Jam PRO/FAD

FEATURES
Virtual reality
ACC 98 report and photos
Digital Cameras

MUSIC
Easybeat
Steinberg Pro 24 II
Digital Home Studio

SOFTWARE
NVDI 5
CD Writer
ObjectGEM
Joe HTML Editor

Plus reviews of ExtenDOS Gold, CD/DAT clock, RSCView, Finder,
Ghostscript and HTML-Export.

In addition there are all the usual regulars and features such as the
DA Layout tutorial and those pages from the Maggie Boys!

64 X A4 pages of Atari news and information.

AC is available on direct subscription from the publishers or via our
agents in the USA, Sweden, Norway, Germany, Australia, Nederlands and
New Zealand.

Please see our web site for full information or email us direct (see
sig file below).

I never mentioned, and not even thougt about on-the-fly.

I would have liked internet software that compresses before uploading,
which suites the ftp site, and decompression as an option after downloading.

I can use the same software to do the decompression offline later on.
I dont need to know what compression method is used.

That's all.

Henk.

hahahahaha!!! I ran into that one too there. Some one was really really
brilliant. Regardless, I hate ZOO. But really who would ZOO ZOO??
I remember my frustration.

Finally, if I recall. GZIP doesn't work on TOS 1.0.
Small characters, large characters problem.
However, I discovered it worked on my STe.

People often say reality is worse than fiction.
I always thought these where not so funny, sort of cliche, jokes.
And you wont believe this: there actually where 2 zoo's.
zoo.ttp & zoo.zoo ;-)
But I rejected the suggestion.
I was afraid that this would give me a zoo.tar. :-)

>that some software isn't.

It could be, but I've just tried a roll-over from 1999/12/31 and, before
a reboot it had the correct date. After the reboot, it thought it was
2028/01/01. This is with TOS 1.62 and Magic 5.11, not that Magic will
make any difference here.

>Maybe its the clock program or control panel program you're using. I
>do know that the clock setter program for Forget-Me-Clock cartridges
>has problems. Have you tried the latest version of the Control Panel
>software called X-Control?

What's the latest version? I'm using v1.31 and it refuses to allow entry
of a date ending '00'. Can anyone else confirm this, or point to a
version that does let the dates be set to 2000 and later?

BTW, this isn't the first time I've noticed this. It seems that the
keyboard processor clock has a problem with dates after 1999. Not sure
what effect that should have, but IIRC the GEMDOS clock gets reset with
every reset, whereas the XBIOS clock, using the keyboard, doesn't.

>Your posting is a very good example of such a phenomenon.

You put me in a wrong category.

For already 2 years I use MiNT.
Lately a switched over to 1.15.

All that my TT runs is N.AES with Thing.

I indeed have MagiC but latest use dates from 3 month back.

I follow Mint-mailing list now for a few weeks.

The only thing I miss is: I do not know C language.
But why should I?

Look out for the coming thread 'One of these days...'
I will describe the setting up of Mint, MintNet, etc with help of the
Mint98 disk (bought recently in Neuss....)

And further: never heard of teasing?

I will keep on showing an independent and may be stubborn attitude
about Mint-things being an enthousiast user of Mint myself.
I love all those complex commands that need to be typed in (on
the wall I have a paper with all these commands, switches and so
on for easy access) but, at the same time I am not a mouse-hater!
And I have no problem spending 4 or 5 hours reading a manual before I
can get a piece of software running.

Met vriendelijke groet,
Ronald van der Kamp

... know exactly what U're talking about:
in the first year with my Atari ST, vanilla TOS 1.02 (no drag&drop, no desktop-with-features) I simply got an arc.ttp or unarc.ttp from a friend with no docs (he didn't know much about it either). So at least I should have been able to handle ARC archives, but I never managed to get it unpacking, probably because of faulty handling from my side... I recall ending up with around 5 different versions, since everybody assisting had another one, and no-one really knew how to operate them.
Anyways, I connected to BBS's by means of a F-A-S-T modem (2400 bauds) and some real dumb terminal program, and looked for a LZH depacker. Had to connect to several bbs-es before I ran into a TOS version, then had to go look for a dezipper etc, same problem. When I finally had at least one for ZIP, LZH and ARC archives things got better all the way, Two in one came in quite handy and that's where I fetched ZOO-214 too. I printed out all the docs... essential!!!
Later I added ARJ, MSA, RAR, TAR and GZIP stuff. Even fetched PC-versions for ZIP, RAR and ARJ to run with Soft-PC.
ZOO never was used much on Atari systems, but I recall it's the only one of the oldies allowed to be used under Unix environments...

I don't have that version, I've still got v1.00 (I don't use XControl,
as I prefer Cops) but on my Falcon this version accepts 00 dates.
Maybe though that doesn't mean anything, as the Falcon DEFINATELY is
millenium compliant.

> BTW, this isn't the first time I've noticed this. It seems that the

Do you use StiNG to connect to the Internet? I ask because my StiNG
setup runs a prgram during the connect process which fetches the
correct time and date from the Net, which (because the server runs
UNIX) is also millenium compliant. This way my clock is correct all
the time, and I only have to adjust for Summer/Winter time.

Cheers!

James

Anyone have bigdos and caf to work I have bigdos finally
happy with everything else but the CAF file_system.
I have tried the Cubasefix.TOS in various auto
folder positions or run from desktop.
Seems better with the cubase file_selector module
thrown out, getting bombs and recording is impossible.
loading other stuff like MID and ALL ect
seems stable.
Anybody having better luck than me.
Thanks BILL

>
> I'm not exactly sure what you mean by "multiple channels". The browser
> itself has the "look and feel" of Netscape v4.5 with a little of the
> familiar CAB also.

Multiple channels mean that CAB will download several i.e. pictures simultaneously, not one by one like Atari CAB does. It can be very annoying if there like 100 pictures on page and each size is 5x5 pixels and those pics have been used only to arrange layout. Ofcourse you can use advertizing filter to strip those but you never know what is relevant information and what is not if you dont look it once.

> I do hope that Alex is still supporting CAB. v2.7 could use an upgrade.

I hope it too ... I have spent quite many FIM's to different CAB updates ... I don't want to hear that support for Atari CAB is history.

>Could you possibly make more sense? In the first paragraph, you say
>probably will not work, and in the second, you say you may load any
>TOS.

TOS loader is usual name for normal startable program, and this is one
difference to Boot loaders.
Other difference is that TOS loaders perform load and relocation of ROM-TOS,
while boot loader loads special TOS, which is made for run from RAM, and is
of course relocatible.
TOS loader you may start only if you are booted up with some TOS already .
Boot loader you may use on machine without ROM TOS, just with couple KB of
ROM, for boot. First version of Atari ST were such, because TOS wasn't
finished in time (year 1985) .
TOS loader works usually so, that loads ROM TOS to end of RAM, and then
relocates all required long (4 byte) addresses, and often set reset vector
to his start, so after pressing reset button user must not load it again.
I made couple TOS loaders. TOS is stored compressed, loader first
decompress it to RAM end, then relocates and starts via reset. Relocation is
solved very interesting, by TOS loader from some German programmer (sorry,
I don't remember his name). To save table space, only addresses, which
should not be relocated are in table . It sounds nonsense to first look, but
I can't explain too detailed here, I wrote already too long message. Finding
that addresses requires some time and testing. So I can now load TOS 1.0,
1.04 and TOS 2.06. But here we are again at copyright theme...

>
>No such verson of what?
>
>what is longer than older TOS's, and is it relevant?

TOS 2.06, and it is longer than TOS 1.xx, it is 256KB, while TOS 1.xx is
192 KB.
When you load some code, you must always give length of it...

>
>Let me explain what I wrote before more simply: Bootsector points to

See above.
Short: you may not use ROM TOS (what use TOS loaders) instead TOS.IMG.

Cheers, Pera

DOITF030 HTML V 6.3.2 Hardware Tip & Tricks Atari Falcon F030

Sie werden in DOITF030 alle Kabel- und Schnittstellenbelegungen
neben den Custom Chips und ihrer Beschreibung finden. Auch viele
Bau- und Umbauanleitungen zum Atari Falcon F030. Insidertips und
komplette Reparaturanleitungen runden das Angebot sicher ab.

_DOIT_ST_ HTML V 2.5 Hardware Tips & Trick Atari ST Serie

DOIT_ST enthï¿½lt Tips & Tricks rund um die Hardware, Customchips
Komplette Beschreibungen, Reparaturanleitungen und Bauanleitungen
fï¿½r Zusatzhardware.

DOITMAC HTML V 1.1.5 Tips & Tricks zum PowerMac

Sie werden in DOIT_MAC viele Kabel- und Schnittstellenbelegungen
neben ihrer genauen Beschreibung finden. Ebenso viele Tips & Tricks
sowie kleinere Umbauanleitungen zum Apple PowerMac oder PowerBook.
Allgemeine Daten und Insidertips runden das Angebot ganz sicher ab.

DOITSOFT HTML V 1.6 Informationen ï¿½ber Atari Software CD-ROMs

Eine Zusammenstellung und Zusammenfassung von Informationen
und Inhalte verschiedener CD-ROMs mit Atari Software. Sicher lï¿½ngst
nicht alle, das liegt aber an Euch. Ich kann und will nicht alles kaufen.

PROFIJAG HTML V 2.7 Tips & Tricks zur Atari Jaguar 64 Bit Hardware

Sie werden in PROFIJAG alle Kabel- und Schnittstellenbelegungen
sowie auch Teilweise die Originalschaltung neben den Custom Chips
und ihrer Beschreibung finden. Bau- und Umbauanleitungen zum Atari
64-Bit JAGUAR. Insidertips, komplette Reparaturanleitungen fï¿½r
Systemteile der Konsole, farbig bebilderte Beschreibungen aller
mï¿½glichen Videoanschluï¿½kabel sind die Highlights dieses Archivs.

DOITLYNX HTML V 1.6 Die Reparaturanleitung zum Atari LYNX Handheld

DOITLYNX enthï¿½lt neben den Pinbelegungen aller Schnittstellen auch
die Pinbelegungen der Custom Chips, des Modulports und des LCD-Displays.
Von allen Baugruppen sollte sich so eine Beschreibung finden lassen.
Komplette Reparaturanleitungen fï¿½r Video, Sound und Stromversorgungsteil
empfand ich bei der Herstellung des Archives als Pflicht.

DOITSPEED HTML V 1.1 Atari, Mac ISDN und der Hagenuk SpeedDragon

AT-Kommandos, kurze Beschreibungen der wichtigsten Dinge.
Inbetriebnahme und wie man es vermeidet lange Sinnlos zu suchen.
DOITSPEED ist eine Kurzanleitung zum Speed Dragon, enthï¿½lt Tips

zum Betrieb am Atari und Mac.

DOITDRIVE HTML V 1.2 Allgemeines zum Festplattenanschuï¿½

Allgemeines zum einfacheren Handling von IDE und SCSI Festplatten.
Nicht Plattform abhï¿½nging. Enthï¿½lt Jumperbeschreibungen, einfache
Richtlinien, Terminierung und Tips aus Benutzersicht.

DOITMILAN HTML V 0.0.4 Milan FAQ

DOITMILAN enthï¿½lt das was mal eine Milan FAQ werden sollte.
Das Projekt liegt seit geraumer Zeit wegen Informationsmangel auf Eis.
Man kann nicht seine Freizeit damit verbringen versprochenen Informationen
nachzujagen oder mehrfach danach zu fragen. Irgendwann steckt man das mal auf.
DOITMILAN enthï¿½lt einige wenig Tips zum Milan, der Rest stammt aus
DOITF030 und dient als Beispiel dessen was eine MILAN FAQ enthalten sollte.

Beschreibung:

Einzelbeschreibungen erhï¿½lt man unter:
http://www.rhein-main.de/people/robert/info.htm

Preis:

-=FreeWare=-
Verschlï¿½sselte Archive
Den Schlï¿½ssel einfach per E_Mail anfordern.
Das geht sehr schnell bei Leuten die mal eine Spende
entrichtet hatten.

Hardware:

DOIT-Archive kï¿½nnen mit einem beliebigen Atari oder
sonstigem Computer, sofern ein Web-Browser vorhanden
ist, betrachtet werden. Vorzugsweise Atari CAB, Netscape
Communicator oder dem InternetExplorer.

Unter VGA ist eine Auflï¿½sung von 800x600x256 erforderlich!
Fï¿½r einige Bilder ist eine hï¿½here Auflï¿½sung besser.
Benutzen Sie GEMJing zur Soundausgabe unter MagiC.

I tried it a couple of days ago with my STFM TOS 1.02, using
Magic. I put the CLOCKPCH.PRG in my AUTO folder. It didn't like that at
all, - came up with some weird dates. I then tried it without the
CLOCKPCH.PRG and it went on to 00.01.00 and 01.01.00, no probs.

My XCONTROL is ver. 1.00.

INFOCOM ADVENTURES
Also offered for sale are the following ORIGINAL Infocom adventures -
complete with "clues" (except where noted). Excellent software, also ideal
for Psion users with Frotz (S5) or the S3 Infocom interpreter.

Planetfall
Stationfall
Deadline (Mastertronic)
Wishbringer (Mastertronic)
Sherlock - Riddle of the Crown Jewels (PC)
Lurking Horror (PC)
Hitchhikers Guide to the Galaxy
Bureaucracy (PC)
Zork 1

PC versions can be used on the Atari - just copy the .DAT file and rename
the .PRG file to suit!

Sensible offers for any of the above considered!

Regards,

Ian B

I've been having a clear-out and would like a good home for the following:

Canvas (commercial version)
16-Bit Hit Machine comprising: Super Cars
Skidz
Switch Blade
Axel's Magic Hammer
Impact
Sim City
Atari Archive HD utility
Superbase 2
Balance of Power (original version)
Macadam Bumper (pinball sim)
Prospero C
Fleet Street Publisher 3
Calligrapher Gold including the following additional fonts:
Commercial Script
Century Schoolbook
Garamond
Garamond condensed
Hyperchart
K-Resource 2 (.RSC editor)
Silhouette (bitmap and vector drawing program)
1st Word Plus (complete)
Timeworks DTP (complete - original version)
Turbo Toolkit HD utilities
a pair of MegaSTe TOS ROMs v2.05UK
Vortex ATOnce 386 16MHz PC emulator for the MegaSTe including full version
of MSDOS 5 (including documentation).

Sensible offers for any of the above will be considered!

James, so do I. My system runs UTC, so no fiddling with summertime.
BTW, you can automate the process for summertime:

Check Sting's Default.cfg, for the line TIME_ZONE = whatever, then add DST
+60. Next add the line TIME_SUMMER = 03.30.10.26 where the first is the
date summertime starts and the last is first date for wintertime. Only
need to update the line for every year...

Erm... couple of things here....

1) Magic *might* make a difference - it replaces the whole of TOS, including
date I/O functionality.
2) The change is after a reboot.... cold? If so, then its NOT your ST that
is dealing with the clock, as a plain STe doesn't have a battery backup...
you must have a clock-card or something.

>BTW, this isn't the first time I've noticed this. It seems that the
>keyboard processor clock has a problem with dates after 1999. Not sure

I'm pretty sure that is NOT true.

(lots of TTs)

> Further a lot of hardware of which I mention in this context:
> 1. 3 so called BioNet boxes that connect to DMA.

Good enough for STs, but definitely not for TTs.

> 2. 2 VME-bus cards named Reibl for in the TT

Perfect for the TTs and supported by MiNTnet drivers found
in MiNTnet 1.03 - excellent choice.

> 3. a 486-DX 8 Mb DOS-box as server with 1.5 Gb SCSI-drives

Should run Linux and be used as a gateway for the Atari machines,
driving a small hub. Also, using a spare serial port with IP
masquerading (on the PC) you could connect the Falcon, which won't
work using the Bionet nor the Riebl (as you've already noticed)

>"Hi Jo, what's up? No longer an Atari fan?? How come??? Greetings from Jos"
>
>PS: I know you got two, so I don't worry :-)
>I figure Jo's trying to swap one TT for newer hardware...

I will DEFINITELY NOT BUY "NEW" hardware ... I'm a kind of computer
antiquary ... I do like old machines with very cheap prices ! This
allows to change definitely faster rather than buying new expansive
machines and wait five years before changing ...
If you think well you can use excellent computers for about 1/15 of
their genuine price, they were really too expansive at the moment they
reach the market ...
I also like any kind of second hand market like cars ...
Why spending so much money on new toys which will quickly
become obsolete and loose their value much quicker ?

I will not leave the atari usage because I continue to use my second
TT each day ... it's also graphic card equiped ... so I can avoid to
keep both ... Too much material is not good for me :)

3282. SX212 Modem Power Cable

Newsgroup: comp.sys.atari.st
Date: 1999-02-21 00:00:00 UTC
From: Darren Nelsen <dnelsen@campus.mci.net>
Message-ID: <7apqrc$v1j$1@camel29.mindspring.com>
Source record: 83898
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hello,

I'm looking for a power cable for the SX212 Atari Modem. Does anyone have one they want to get rid of or know where I can get one?

Thanks!

Darren

3283. Carrier Command for the PC?

Newsgroup: comp.sys.atari.st
Date: 1999-02-21 00:00:00 UTC
From: Spyderbyte Internet Cafe <spyderbyte@tinet.ie>
Message-ID: <7apsfr$2o2$1@scotty.tinet.ie>
Source record: 83899

Does anyone know if there is a version of Carrier Command available for the PC? If so, can it be downloaded from the 'net? Are there any good sites that have PC versions of other ST games?

Any help would be very much appreciated.

Thanx All

Mark

3284. Re: TOS 2.06 Manual

Nice description !
However, I couldn't resist from some corrections :-) .

>.........At 256k it is double the size of the preceding versions which were
>128k.

Older versions like TOS 1.0, 1.02 and 1.04 were 192KB.
.

>Gemulator 96 works well with TOS 2.06. Patching the TOS image with
>TOSPATCH then testing on a PC computer is fast and easy. No more
>blasting eproms!

Right, but you don't need PC for that. You can patch and test TOS 2.06 in
Atari, when it is loaded with TOS loader in RAM end.

>Warm boot
>Press simultaneously Control, Alternate and Delete.
>
>Cold boot
>Add right Shift key to the preceding. Equivalent to the reset button
>at rear of computer.

Pressing reset button performs normally warm boot. Which boot will happen
depends mainly from system variables 'memvalid' .

>Format Floppy Disk...
>TOS 2.06 formats diskettes which can be read by PCs and compatibles.

I use German TOS 2.06, and it formats floppies of 720K with 5 sector long
FAT, what is not PC compatible. I observed improvement, that sector 'skew'
is used, what results with faster floppy read/write. Can you give exactly
format, what your version of TOS 2.06 formats. FAT length in sectors, DIR
length in sectors and cluster size in sectors.

For end: could you specify me, where exactly can I find some TOSPATCH's for
German TOS 2.06.

Regards, Pera

Source record: 83901

```
at, http://kellis.atari.org
or, http://users.leading.net/~kellis

1.3 adds the HTML build option.
Very handy to know how the browser is gonna tile some picture for
backgrounds, or see the transparency of the main centered picture.
Comes with a default gif file to test. (tester.gif)
1.3 Now uses Pwait3() call. If your OS doesn't support it, expect weird
results. (magic seems to work fine)
1.3 few extra bugs fixed
1.4 has separate edit fields on which you can drag and drop files.
No need to use the fileselector at all.
1.4 uses OLGA to refresh CAB.
1.4 forwards all the unused keys to the av-server.

Thanks.
```

Press the Alt key when the floppy drive light comes on during bootup. This bypasses the hard drive. You then need to use a floppy based hard disk driver, install drive C, open it and deal with the faulty accessory.

Someone pointed out that pressing the Ctrl key on the Hades during boot will install the hard disk driver but not the accessories. This is very handy as it means you do not need to have anything on a floppy. I don't know if this will work for an STE.

Hi Vincent,
I have these modules for sale. Unfortunately the stle trax doesn't work anymore. I think I did something to it on the master
disc. The studio and cuetrax work fine. These also contain full manuals from Steinberg. I paid $200 CDN for all 3. I would like to get $100 CDN.
I think the style trax can be replaced. I'll work on it on this end.
Let me know if you are interested.
Mike in Canada.

In addition, most of use a BOOT Manager which allows the selection of
ACCs, AUTO programs and, depending upon which manager, provides other
features. One big benefit of these managers is being able to test and
disable various "problem" programs during BOOT.

You should be able to find BOOT managers online, although names escape me
at the moment (I'm using a commercial manager XBOOT).

Source record: 83909
Cross-posted to: alt.games.lynx,rec.games.video.atari,comp.sys.atari.st

This is another call to sign up now for JagFest '99 in Rochester, MN, on June 18, 1999! Join Atari fans from all over as we "Celebrate Atari" in the Midwest this year.

Note that the 'fest is open to Atari ST/Falcon user groups as well, who may be interested in attending or demoing or selling products. I'd like to see the 'fest promoted in as many web sites and 'zines as possible.

People are welcome to copy the graphics off the JagFest website to use as links to my page. Speaking of the graphics, note that I left two spots open on the jfbig.gif graphic. This is intended to accommodate other games that may be demoed at the 'fest.

So, if I receive confirmation that Gorf or Assassin or something else will be demoed, I'd be glad to include it in the graphic. Or maybe the logo of a company that commits to attend.

Keep those sign-up emails coming! We need to build up the roster to entice area businesses to set up shop for the day (several shops in the Twin Cities carry lots of Atari stuff).

New on the 'fest page: We will have a "Rare & Unreleased" exhibit of Atari hardware. Flash ROMs, developer boards, blue & gray controllers, unreleased games, and more! You won't want to miss it.

Thanks,

Carl Forhan

I wonder what the differences are between v1.00 and 1.31. As for the
Falcon definitely being millennium compliant, unless there's been a
change in the way TOS handles the keyboard clock, I don't think it is.
For a bit more info on why I'm not sure, see my reply to Anthony
Jacques.

>
>1) Magic *might* make a difference - it replaces the whole of TOS, including
>date I/O functionality.

It doesn't appear to make any difference as the date still skips to
2028/01/01.

>2) The change is after a reboot.... cold? If so, then its NOT your ST that
>is dealing with the clock, as a plain STe doesn't have a battery backup...
>you must have a clock-card or something.

The change occurs after both warm and cold reboots, with or without
Magic. I've no clock card on my STE so that's not the problem either.
After several tests I can say that GEMDOS *does* have the correct date
after 2000. However, it appears that the problem is with the XBIOS. The
XBIOS, and any programs that use it to find the time, see's 2000 as an
invalid date and returns 2028.

>>BTW, this isn't the first time I've noticed this. It seems that the
>>keyboard processor clock has a problem with dates after 1999. Not sure
>
>
>I'm pretty sure that is NOT true.

I'd like someone to correct me if I'm wrong, but the info I have about
the keyboard processor is it stores the time and date as single byte
BCDs. This means that the date will be stored as 88-99. The rollover
from 99 leads to an invalid BCD being returned for the year and TOS
returns the date and time as $00E00000 or 2028/00/00.

I start a new tread concerning everything that happens when I go
installing a network of Atari computers.

Preface

Every 2 months I have to get the Dutch magazine ST together and make
the lay-out.The issue is with the printer now, so I have time to do
interesting things.

To try:

I will try to make a network based on Mint with Mintnet or may be Net
BSD or whatever, as long is I can go on doing the normal jobs with
GEM, so no Linux. Suggestions of what to choose are welcome.

Hardware

We have gathered at the secretariat a lot of stuff.
1. a TT with 4+32 Mb and 85+85 Mb HD
Is in use for Calamus layout and administration
2. TT with 4+8 Mb and 120 Mb HD as backup for nr.1 and normal in use
for communication (internet, Fido) and whatever (uses N.AES mostly).
3. a TT with 4+12 Mb, 85 Mb HD that was given to us a short time ago
by a firm that stopped using Atari.
4. a Mega ST4 with 20 Mb HD also given by a ex-reader of our magazine
5. a 1040 ST only also from a ex-reader
6. a Falcon 4 Mb, 65Mb HD borrowed from Atari Benelux just before
they went bust.

Further a lot of hardware of which I mention in this context:
1. 3 so called BioNet boxes that connect to DMA.
2. 2 VME-bus cards named Reibl for in the TT
3. a 486-DX 8 Mb DOS-box as server with 1.5 Gb SCSI-drives

What is running?
At the moment I have all 3 TT's running with the server on a Bionet
that is based on real TCP/IP. 10 Mb/sec goes through coax cable.
Every TT has its own mapping of pseudo-partitions on de drives in the
server, configuration according to login. There are remote network
printers and a mail service.
Stuff works with N.AES and normal Single TOS.

Network

I hope to get the following configuration: 2 TT's with Riebl, 1 with
Bionet what leaves 1 Bionet to connect the Mega ST4 and one to

connect the 1040 ST.
Problem1: will there be enough memory left on the 1040 ST when all network software is booted from floppydisk?
Problem2: tye Falcon has no VME and no DMA. LAN-port seems best. Is that a go or a no-go?

First step

I will back-up all the harddisks onto 44 Mb Syquest disks.
I will read the manuals that come with the CD-ROM 'MiNT98'. Then, on a totally Clean Machine (TT number 3) I will put a auto-folder with minimal stuff (CD-ROM driver) and a HDDriver.sys boot.
The harddisk will be empty and newly formatted.
This system is tested already especially the SCSI and no errors are found. Remember also that the Bionet worked so the hardware is working.

Second step

Another TT will be transformed (I think nr. 1) to a network client.
Also with a Bionet box.

Third step

I will try to exchange the Bionet for the VME Reibl hardware.
On the MiNT98 disk are drivers.

More steps ahead I do not take yet.
But I see some problem not related to Atari: that DOS-box (with so much harddisk space in it) can run W3.1 and there is software on de CD for it. But I do not know that system.

Are there people around who have done a thing like this?

Please let me know if it is possible theoretically at least!!!!
I do not want to spend time on the impossible.

Met vriendelijke groet,
Ronald van der Kamp

Hi Folks,
I'm looking for Studio module, Cuetrax and styletrax....for Cubase 3.01
Atari
(I don't need & want to upgrade to PC or MAC)
(originals please)
Perhaps you have it or know somebody who has it.
Personal email would be appreciated !

Vincent CORNEILLIE

Apologies in advance if I've misinterpreted what you're saying, but I think there is some confusion here about the clock patch program. It doesn't address either rollover issues or setting the time with the control panel.

Rollover issues are only of relevance to real time clocks. The standard ST doesn't have one built in, so you either have to fit an internal clock module or use a clock cartridge. My knowledge of internal modules is zip, so I'll restrict myself to cartridge clocks, specifically the Forget-Me-Clock. Some cartridges certainly will roll over OK into 2000 (eg the Forget-Me-Clock), but the setter programs don't work properly. By this I mean the programs which you use to set the clock in the cartridge: you can't enter 21st century years. There may also be a problem with the small auto program which reads the time from the cartridge at bootup, though IIRC the Forget-Me-Clock auto program is OK (it's a while since I tried it, though: please allow for brain cell deterioration).

The clock patch addresses the issue very simply: as the setter program can't set years in the next century, it allows you to set 20th century dates *in the cartridge* to which it adds 20 years. For this to work the year in the cartridge has to be between 1980 and 1999. So for 2000, you set the year in the cartridge (with the supplied setter program) to 1980, which is within the FMC's setting range. At bootup, the AUTOFMC.PRG reads the cartridge and sets the date to dd-mm-80. The clock patch program then runs after this (order of execution is therefore important) and adds 20 years to the date, making it dd-mm-00 in the internal clock.

What the clock patch program does NOT do, is fix setter programs which can't deal with 21st century dates or do any other kind of magic. If the cartridge has rolled over to 2000 and not been reset by the setter program then the patch will not work properly as it only adds 20 years to dates between 1980 and 1999.

It's worth noting here (as stated on my Y2K page, if that's where you found it, though it's on at least one FTP site, too) that the clock patch seems to work for some and not others: the author no longer works on it, so it

won't be updated, unfortunately. It does work for me on an STE with MagiC 5.03 and a Forget-Me-Clock, YMMV. By "works", I mean that LED Panel reports the year correctly, as does Papyrus while inserting the current date in documents. More than that, I haven't delved.

WRT setting 21st century dates using XControl, I'm sure I tried it and it worked, though I generally use COPS which doesn't have date/time setting built in. I can't really see what the clockpatch would have to do with it as I can't think of a reason why it would stay resident, unless its a bug of some description.

If anyone can shed any light as to Y2K compatibility of Xcontrol (and versions) or other time/date setters etc, please let me know (mail to y2k @ whalley.demon.co.uk - remove the spaces!) or post here, as I'd like to add any such info to the page at:

MiNT+N.AES is your only choice. GEM-programs will not run under
NetBSD.

> Problem1: will there be enough memory left on the 1040 ST when all
> network software is booted from floppydisk?

Definitely not.

> Problem2: tye Falcon has no VME and no DMA. LAN-port seems best. Is
> that a go or a no-go?

This will work fine, connect it to one of the TTs via the LAN-ports.
It won't be fast (~20Kb/s), but it will work.

> But I see some problem not related to Atari: that DOS-box (with so
> much harddisk space in it) can run W3.1 and there is software on de
> CD for it. But I do not know that system.

Ditch DOS, install Linux. I have Red Hat 5.0 on a 486 with 16Mb and a
huge (physically) old Seagate SCSI-disk, it's very stable and
reasonable fast. It runs a web-server (http://atari.nvg.org) as well
as serving as my main login-box at university.

> Are there people around who have done a thing like this?

Michael Schwingen is the one you should talk to, he has heaps of
Ataris and PCs in various configurations networked.

>then when I try to do any other function, or use the drive,
>it gives me the error message "No Partition

I know this may sound rather stupid, but it is a mistake more
people make:
When you partitioned the drive and installed the bootsector,you
quit HDDRIVER and nothing happens? except for the error message?
Reboot the computer, 99% chance it will work. Without a reboot
TOS doesn't know about the new partitioning and gives a error
message....

3314. A-ONE... A NEW Atari Online Magazine

Newsgroup: comp.sys.atari.st
Date: 1999-02-21 00:00:00 UTC
From: jmirando@portone.com
Message-ID: <7apa3u$7pj$1@remarQ.com>
Source record: 83984

For Immediate Release

Former Atari Editors to Debut New Online Magazine

[February 19, 1999, Boston] Former STReport Atari Editors Dana Jacobson and Joe Mirando announced today that they have begun work on a new Atari online magazine. A-ONE (Atari Online News, Etc.), which will likely debut on Friday, March 5, will be a magazine primarily aimed to serve the Atari community, according to Jacobson. "Our goal," said Jacobson, "is to focus on a magazine which covers material of interest to fellow Atari users. We'll do our best to cover all facets of the Atari experience - computing and console gaming. But, we'll also cover topics that are of a general interest to Atari users: general industry news items and other gaming platforms."

"Joe and I have been using and writing about Atari computers for a long time," says Jacobson. "Between the two of us," he added, "we've probably written for most of the commercial Atari magazines of yesteryear such as Current Notes, Atari Interface, ST Informer, and Atari Explorer. And we just completed a lengthy stint with STReport, an online magazine. We have both considered doing an Atari online magazine on our own for quite some time now. The talks became more serious the past few weeks and many of our STReport readers were asking. The timing was perfect."

Jacobson states that A-ONE readers will see the same coverage as they did with STReport, but more. "Columns such as 'People Are Talking' will continue in A-One," states Jacobson, "and the Atari news items, various announcements and product descriptions will continue. We're also going to continue with the computing and technology industry news section, as well as Atari and other platform gaming news. All of that will remain unchanged, except cosmetically."

When asked what new things A-ONE readers will be able to see in the magazine, Jacobson reported that "we have a lot of new ideas; and we're going to be able to resurrect some old ones! We've talked to Michael Burkley, of Suzy B's fame. A-ONE readers will be happy to learn that Michael has agreed to bring back his "Unabashed Atariophile" column - a column devoted to Atari public domain, shareware, and freeware software. We're also looking to get more involved with Atari internet news. We're working on 'guest columns.' We'll be talking to a number of people to help us make A-ONE the #1 Atari online magazine worldwide."

According to Jacobson, A-ONE will be a text-based magazine. However, he stated that an HTML version hasn't been ruled out as an additional format. "We're in the process of establishing distribution points for the magazine," Jacobson stated. "We'll maintain our e-mail distribution

lists as well as making the magazine available on online services such as Delphi and bulletin boards. We'll also make it available for downloading via numerous Internet web pages. The best way to do this, and make it accessible to all readers, is text. But we realize that some of our readers may want to read A-ONE while on the Internet. The 'plain' text version will be available initially, but we're also considering adding an HTML version, with all the 'eye-candy,' for those who might want it."

To contact A-ONE regarding e-mail subscriptions or other inquiries, send e-mail to dpj@delphi.com . For submissions and related information, send e-mail to jmirando@portone.com .

Hi. Yes, depending on which hard driver software you are using, you can
bypass the HD bootup, and/or ACC-Auto folder software.

(keep in mind I'm referring to ICD's Pro Utils v6.5.5 here, although I
hear HD Driver is very similiar)

1) <control> at the boot up prompt bypasses all Auto folder programs and
ACC's.
2) <alt> at bootup, right after the very -1st- floppy drive access, causes
only the floppy to boot up.
3) Note that many desktops/alt OS's have combo's that bypass them as well.
Neodesk does this, as well as <L><shift> with the Mint kernel...

Hope this helps some! ;-)))

I've wrote a program which you can set the time as 4 digit year. The
Atari can handle that. Email if you want it emailed

I'd check the login script first by using a terminal program, dialing
in to uour ISP and manually logging in to make sure it works to that
point. Then........

My advice is: make a Blitz-cable.
You need two nearly indentical floppy drives.
The software and construction manual is for download in many places.
I even managed to copy floppydisks disks from a programmable sewing-
machine!

(Yes, someone has made a Atari 8-bit BBS telnetable! I realize this
may not be anything special in the ST world... but for Atari8 users this
is a great triumph!
Especially since I miss visiting my Atari 8-bit BBS'ing days of
1985-1989. With any hope, with the release of the "Pro Gold" version of
Express, it will spawn a new commnity of telnetable Atari 8 BBS'es.)

How did the commercials go... "Great for Atari..." ;)

Hi All,

Thanks to the tips about the above problem (including whoever emailed me - Newsie deleted the file as I got it !).
It turns out that my problem ftp site was hosted by monolith - which closed down in December !! Luckily, Flinny was able to give me the numeric option to regain access to the actual site.

BTW, he was running a little utility called MS Look-up (on the PC as he still has not got his Falcon back). Is there a similar programme for the Atari ?

> Kaffe has been ported to MiNT.

Although the Kaffe port was a great job, it's only the VM. You can use
the standard I/O classes with it, but the most important AWT is still
missing (AFAIK). Without an AWT it does not make any sense to support
Kaffe in CAB.

bye, Thomas

D > I'm looking for a power cable for the SX212 Atari Modem. Does
D > anyone have one they want to get rid of or know where I can
D > get one?

I bought mine at Radio Shack (electronics parts stores, US). Read the bottom (back?) of the case and buy a 'brick' that matches the data, preferably with their 'universal' connector set. IIRC, 9volts at 100ma does the job. The tip is 'plus', the shell 'minus'.

Of course, when you get done you still only have a 1200 baud modem, but it is still fun. And you can use it as a null modem between your 8 bit and an ST. Networking, anybody?

Atari Computing first impressions..

This is the first time I read Atari Computing.
12th Issue, I guess I should have subcribed earlier.
I already missed 11 of them.

Good quality magazine, all in b&w.
Full of info, many pictures/screenshots.
The layout is clear and looks professional.
The writing style is simple, efficient, leads to the point.

All screenshots under magic, which I can understand if all
writers use Magic.

I guess no one uses MiNT, and that nothing new has happened.
Oh well, I can pass on this one very easily :) the magazine is worth
it.

One thing really strikes me though.
They talk a LOT about GEMTRADE, as if it was THE HYPE
application. We could start another thread on this topic ;)

Atari folx, if you love Atari, get subscribed.
Even System for Tomorrow in the US can get you Atari
Computing.
Email at sales@SystemsForTomorrow.com

Atari ain't dead yet.

Euurk! I dont ever recall having SAM cause this problem while running
single TOS on my machine (TOS 4.04, 14megs RAM upgrade from
Titan designs).

> Also, can someone explain why the Falcon can only access 14megs?
> I know you can access more with a major upgrade board. But what
> exactly causes the limit with the standard Falcon?

The wonderful foresight Atari had is the cause of the 14Mb limit. The
limit is imposed by the machine and only hardware upgrades combined
with software patches will allow expansion past this limit. 14Mb is
still a LOT of space for a Falcon cos most software I have doesn't
use up a fraction of this! :)

> As for a re-write of SAM. If it is a software bug. Then that would be
> cool. If someone will do it. I think SAM is great except for this
> sample playback problem.

Someone should do a SAM clone but write it in a better way than the
original. The original is cool but it is pretty old now. I'd like most
features to be kept including assign sounds to specific keystrokes.
I used to have each keystroke announce itself ie... pressing 'A'
would trigger a sample that said 'A!' :)

Some system event triggers that work under TOS don't trigger in
MagiC so maybe a new clone could address that issue...

They can do Java on iCAB because iCAB just needs to hook into the Java
VM (virtual machine) which is supplied with MacOS v8+. The problem
with Atari version of CAB is that a Java VM HAS NOT BEEN WRITTEN
yet!!

Once a Java VM is written for Atari then CAB I'm sure will use it...

Until then I'll just have to borrow time on my Dads Mac to continue on my
'make myself more employable by learning Javascript' quest...(sigh!)

>
> Who knows anything about this?

Not sure if Alexander has left the scene. iCAB looks to have taken the Mac
world by storm if the feedback in comp.infosystems.www.browsers.mac
is anything to go by. Mac users are very impressed with iCAB thus far,
even at the beta stage which it currently is at.

Personally I think converting CAB to Mac and calling it iCAB is a brilliant
idea. Just look at the size of userbase Alex now will have! We're all on the
planet to try and provide a future for ourselves and our families, and with
the support that Alex seems to already have found from the Mac world I
take my hat off to him, for I would imagine that this move will provide
Alex a comfortable future.

Also I DO hope that Alex and Application Systems Heidelburg still keep
supporting the Atari platform. I wouldn't hold a grudge if Alex didn't stay
with Atari though, because it really comes down to what he can get out
of the platform. With no immediate support for CGI, Java VM, Jscript,
Javascript, and other internet technologies looming for Atari users it is
expected (by me) that the way forward is also sideways (to Mac). Doing
a Java VM or Javascript compile would NOT be an easy or one man job
for an Atari programmer or team!!

Could it be to do with the clock installed in your STe? The STe is NOT supposed to have a battery backed clock unless you install one. You can enter the date and time on ST's by using AUTO folder software that sets the BIOS clock when you actually TELL it the time. X-control will help too I think as the ST/e control panel is not as good.

Monitors that work with the STf are Atari's own SC1224, SC1435, SM124.

The SC1224 and SC1435 are colour monitors that use the STf's low and medium resolutions (low is 320x200 pixels, 16 colours from palette of 512) (medium is 640x200 pixels, 4 colours from palette of 512). The SM124 is a mono monitor and uses the ST's high resolution mode only (640x400 pixels, black and white only). Check local pawn shops etc...

Atari TOS (The Operating System) is pre-loaded in ROM. Thats a pretty frugal OS but it does the job...

Plenty of documentation exists on the net. Type 'Atari+ST' on any search engine and take your pick from the hundreds of resulting web pages found with such info

on them...

Actually, high density drives work fine (but you can't use hd - only 720k).

J > The power conections and data connections are standard.

No. The power connector looks standard but must be plugged in the 'wrong' way, which doesn't work very well. But you will fry the drive if you plug it in the 'right' way. I ended up cutting the power wires and splicing them back together with the +12v and +5v reversed.

You won't fry anything if the data plug is inserted the wrong way, but it won't work. Try turning it the other way in this case.

I had to extend the ribbon cable, as it was too short. And the drive I had didn't fit in the case very well, so I had to hack and slash a lot. You would probably have an easier time by finding: 1) original Atari drive (there are tons of sf354s out there); or 2) 1040ST (with internal drive).

This should be in the Quick FAQ.

WHOOOPPPSSS... again! To all who have the Monitor Master Plus stuff - I found another problem, a bad one, which I should be shot for. And I don't yet know what can be done about it. Don't build the Monitor Master Plus! until I can work out the solution. For those who would like to work on it anyway, the problem is that pins 1,2,3 were in fact in use, switching the audio between the color and mono monitors. Since I used this part of the switch for 'red', the red is very dim - and the audio isn't very good, either. My apologies - and I'll get something worked out soon.

So, you've been able to boot TOS 1.00,1.04 and TOS 2.06 using a TOS loader? I'm looking for these kind of programs for ages! The problem is that I bought the TOS 2.06 board for my 512 ST+ (With 1MB RAM). But I haven't been able to get it to work with my 512 ST or 1040 ST. My 512 ST runs TOS 1.00 and my 1040 ST runs TOS 1.02. I have a copy of the TOS 1.04 Betadisk but this doesn't always work correctly and it isn't very stable also. I downloaded the TOSRELO 2.11 utility but this locks up entirely on my both ST's. And TOSRELO only has support for <= TOS 1.6. Maybe you can helpme getting TOS 2.06 to boot on my ST using your TOS loader.

Please e-mail me your reply. (niels@dbitgroep.xs4all.nl)

Thanks in advanced!

Hmmmm.... Would it be faster if client is asking next packet to come
in from that narrow door right after previous packet is in, not like
now, when first packet has to come in, unpack itself, go to it's plase
and _then_ client is going to door and call next packet in.

Seem like normal doorway in IE, Netscape and iCAB when there can be
occasional rushours in the door sometimes, but someone is allways
moving throug it. Not like CAB, witch seems like security check in
airport checkin ... :)

Just rename the .ACC files you do not want loaded to something
different e.g. .ACD.

Or you could get a boot-manager (XBoot,Superboot) which allows you to
select ACCs, AUTOs etc. at boot-up time.

Formatting never matters since the format of removable cartridges and
hard disk drives is always independant of the platform. The only
important thing is how the medium is partitioned. In other words: You
never have to format a drive or cartridge for use with the Atari,
partitioning is all that's needed.

You have to reboot in order for the new partitioning data to be
recognized. After a reboot you can install the driver as described in
the manual.

> Btw, I also tried formatting the drive and that didn't help a bit.

Be careful with formatting IDE drives. Some drives are damaged by
formatting.

Sometimes there is a complaint about software: the manual is in a non-native language.

In the English world the German language is difficult, French mostly incomprihensible and Dutch is totally Dutch for most Internet users.

But there are translation services.

Has anybody tried the sites

http://www.voycabulary.com/
http://dictonaries.travlang.com/
http://www2.echo.lu/edic/

I was told that they could not only translate webpages but also text.

Or do you get a text that is only more confusing?

Indeed.

> The problem with Atari version of CAB is that a Java VM HAS NOT BEEN
> WRITTEN yet!!

Incorrect. Kaffe has been ported to MiNT.

> Once a Java VM is written for Atari then CAB I'm sure will use it...

I doubt it.

The problem is, we don't have a _standard_ OS anymore on Atari.

All MultiTOS derivatives are using MiNT, so it should be feasable (at
least in theory) and both are officially documented by Atari.

However, in Germany, most people have gone the MagiC way, which is a
serious problem, because Magic deviates heavily from established MiNT/
MultiTOS practices.

So, given the above, how do you suppose things will go?

Either the Magic way (since CAB is sold by ASH) - once someone ports a
JVM to Magic - or compeltely skip the issue.

Then why do you complain that the files on the ftp serer were compressed? In
that case, it is just a matter of internet software on your end that does
not have the functions that you wish.

God doesn't care about material things like Ataris, but I can assure you that He cares about people. Instead of asking what God wants with Atari, maybe you should be asking what God wants with you. As for "Get a life", I find that quite amusing. You're talking to someone who already has received life, whereas you haven't found it yet. For this reason, I will say a prayer for you because I know what it's like first hand.

Sincerely,
Andy Blakely

PS - Never take someone else's word for God's. As far as I've noticed, every "religion" contradicts the Bible in several areas. Trust nobody completely except for God.

Idea for a slogan: Children of the Almighty God use Atari computers, shouldn't you?

Hi ,

I have just deleted from very important file containing folders
from my HD.
I know that this question may have been asked before but is there a
program that can undelete the folders , so I can undelete the files.

Knife ST will only undelete files , as well as a few old PD programs I
has lying around.

Could someone point me to an FTP site maybe?

Many thanks .

Paul Mac

Here here! I've always found Atari to be the next best thing to heaven. Perhaps Atari is that "path less travelled". ;)

BTW, I'm with Andy on that last point... you can receive a lot of wisdom from a church and a group of people, but like all things in life, it is better to see for yourself than trust another's observation. It's true in religion, and all other points of life.

I HEARD from people that Jaguars were a good game system. So I recently bought one and I have to say it's a blast! I want more!

Many areas in life are that way...

To clarify, what is occurring is that the moo is looping and the computer is
not responding to keyboard/mouse input. Effectively a lockup.

I'm using a stock 14 Mb C-LAB Falcon with Geneva/Neodesk. I've been using CAB
only as an HTML reader up till now (since I often am online after work at my
worksite -- do love those ISDN lines), but I need to get home-based WWW up and
running shortly.

It is unlikely that David reads this newsgroup with any frequency; therefore your message will not reach him.

If your intent was to complain about Titan Designs, a less emotional testimony of what occurred and why you feel wronged might make more sense.

For my part, I welcome any attempts on the part of Titan Designs to advance Atari computers, although I must admit annoyance that they continue to advertise for the Nemesis board when they apparently don't have any to sell. I'd love to have one for my Falcon.

Duplicating commonly found items (like XCONTROL) or old items (>5-6 years)
probably isn't worthwhile. Nonetheless, there are many gems of programs that
are not easy to find currently such as the driver I use to have a Jag keypad
as the mouse on my games STe (lets me keep 2 joysticks plugged in). Making a
"Best of" CD that had signs of editing would be much more useful than a
"Here's everything" type of compilation.

You know, that's kind of novel. I have several "Falcon" CDs, but nothing
that is a "512K w/TOS" CD. I could really see giving that away when the Yolo
Atari Club donates or sells low end 1040s and 520s.

I'm not sure that is the case. I seem to recall someone telling me that you had to boot Linux from a minix partition, but frankly I'm feeling a bit lost. I'm going to look for that package Ken MacDonald recommended and will try again.

My Falcon does have an FPU. As for extensions, the CD I'm using is the Floppyshop Falcon compilation. The files have extension .TAR mostly, which is the archival format.

Thanks for the hints -- I need them!

niels@dbitgroep.xs4all.nl wrote in message
<7ar5pjijq1@nnrp1.dejanews.com>...

>So, you've been able to boot TOS 1.00,1.04 and TOS 2.06 using a TOS loader?
>I'm looking for these kind of programs for ages! ....

I must make little correction: it's not correct saying 'boot TOS xxx using
TOS loader' .
Maybe is better saying: install TOS, because TOS loader loads as any other
program, after system boot up.
Anyway, it is similar to boot, and requires restart of machine after
install. And I must say, that I'm not first who made such TOS loader. Why is
not easy to find TOS loaders on the WEB is probably due to copyright
problems.
But this gives me one good idea: making boot floppy, which will load and
install ROM TOS to RAM end.
Actually, I made it before couple years, for English TOS 1.04, just for
experiment, and it works fine.
I remember that it worked only with single sided 9 sector/track
floppy.
Before anyone write me again, that I write nonsense's, I must accent that
this is Boot loader system for ROM based TOS, and is very similar with usual
TOS loaders. Benefit is that you may use it on machine without TOS, like
early Atari 260 ST models.

OK, I will put info about it here soon, but here we again at TOS copyright
problem...
I can only say that if diverse versions of Atari TOS's are still under
copyright, it is pretty nonsense.
Copyright for software old 8 and more years, what only some repair services
sell ? Look at Apple's systems, all older systems are free. And there is a
lot of example that older versions of software are free. And MINT is free
too....

I vote for floppy disk :-).
Serious: newer floppyes are very bad quality. But if you have this problem
often, it could be problem with drive, and not only heads out of alignment.

Demon used to have a web interface to a bunch of these types of tools at:

http://www.demon.net/external/ntools.html

Haven't looked for a bit, but they might still be there.

BTW if all you want to do is a simple DNS lookup, STinG has such a tool
built in.

Hello, how are you? Fine I hope!?! I on the other hand could use some help... I'm Ben Smith of Bravo Sierra Computers. I sell Atari on the InterNet. I've made numerous transactions using the InterNet over the years. More than I can count. Now I have someone who is questioning my ethics. A deal between us went sour and now my reputation is in jeapordy. I admit I could of handled it better. I should of kept my cool and refrained from accusing Frank Traut of Character Assassination and smearing my reputation. For this I offer my sincerest apologies. Still I could use your help. I need some Champions to stand up for me. Over the years I've served a number of satisfied customers. Including a strong base of repeat customers. I would appreciate it if some of my customers would post regarding their experiences dealing with me. I need Champions to redeem my reputation in the InterNet NewsGroup: alt.atari-jaguar.discussion. And if you have a complaint against me, well it's a free country.

==Thanx==

Please direct all replies through E-Mail to bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I do not regularly read NewsGroups.

Hello, I'm looking for help with the Game SunDog. I'm looking for a completely broken copy of SunDog, without copy protection. And for your information I do own a legitimate copy, with Manual and box. I want the Atari ST version, not a version converted to run on a PC emulating an Atari ST. One of the disadvantages of running a copy protected version of SunDog is the Copy Protection. Backups of SunDog are prone to fail. In fact, I've been told, that the copy protection was so good that some factory originals would fail. Another problem is if your disk failed, your saved game on the disk would be lost. Also, I'd like to be able to have more than one copy of the same saved game. Does anyone know where I can get this?

==Thanx==
===Ben===

Actually, the reason I'm doing this is that I 'do' want to get back into Unix
-- though I'd prefer to start from an X-Windows shell.

I've got one that does the same. The trouble is the XBIOS returns the
wrong dates beyond 1999 so any program that requests the time from
there, rather than GEMDOS, gets the wrong date. I've not tried it after
2028 as yet. Once my STE's free, I'll give it a go with yearly
increments to see if, and when, it returns the correct dates again.

>--
>
>.Hello John:

I use 'M " and Ludwig. Both are facinating to work with and it seems
like whole books of music theory are rolled into each of these
programs. Both of them break down the musical elements into
PITCH/RYTHYM and DURATIONS, but go about it in different ways.
"M" is very intuitive and easy to use..just click away and you can
come up with some interesting stuff. Ludwig seems to have more
"control" over the variations with a few more algorithmic options then
"M",but it takes some work. I am still exploring the program.

Tunesmith I have not used...but would LOVE to get hold of a copy!
I posted a Q on Alt.music.midi asking about if anybody still uses
these programs and I got a response by none other then Jim Johnson
himself(the creator of tunesmith)So..that was a surprise!

I would recommend getting M and Ludwig. You can get them at B&C
computer visions for pretty cheap :

http://www.myatari.com

"M" was only $10.00 and ludwig was $30.00 which is not too bad.
They are in California and they are a mail order. When they were in
Santa Clara , I used to rap with Bruce (from B&C) and give him my
latest midi files created on Atari stuff. Good Guy!

Hope this helps! Would Love some more comments on these Great
Programs. How about the PVG in Dr T's KCS Too!

What do you want to do with the ST? Perhaps you could try STiNG, MiNT and
MiNTnet is rather tricky to get working from just one floppy...

> >Ditch DOS, install Linux. I have Red Hat 5.0 on a 486 with 16Mb and a
[...]

8Mb would do, and if you only install the stuff you need it will occupy about
50Mb of diskspace.

He doesn't need IP masquerading to get the Falcon on the LAN. He'll need it
to get his LAN on the internet though, and the Linux-box is the obvious
choice for this.

Hi Folks !,
I heard from the ASH people that an Atari Messe in NEUSS will be held on 10/11 April .
So now you can begin to save money for all those updates, spare parts, rare hard/software.
Perhaps it's a stupid idea, but why not can every visitor wear a badge with his name ??
I know so many names, but have no idea how you look like...
Perhaps terrible, freaked-out with rectangular eyes, but perhaps also stunning beautiful (women ??)
Sorry guys, but I don't fancy you !!
So if there's support for this badge idea, I can pass this on to the organisation, so they can
perhaps supply a little labelling machine or do you prefer to make your own badge ?????

Jos Vlietstra, email <jovlie@xs4all.nl> - My collection :24 X Atari 1040ST,
4 X Megafile 30, 1X SH204, 1X Megafile44, 1X SCSI 500MB ext.,1 X MegaSTE4,

Hello,

ekaljumagi@my-dejanews.com wrote:

->> booting MiNT, copyright Atari Corp" or similar. I've never seen a Linux
>> boot.
>>
> There is no questiong that I'm running MiNT (couldn't get the long filenames
> otherwise. The question is --- How do I know if my CLI is MiNT or Linux?

Long filenames are not exactly a feature for distinguishing Linux and Mint.
MiNT uses the minix filesystem, Linux ext2fs, both allow for long filenames.
Besides that: Linux is the kernel of the OS, the CLI is something like bash
or csh. I am not familiar with MiNT, but I guess it is similar with MiNT
being the kernel and the CLI being something different, possibly bash as
well. So, if the bootup messages tell you, that you are working with MiNT
you can't have Linux and vice versa. You can't boot two kernels at the same
time.

You said you have a Falcon? If this is so and you don't have it supplied
with a FPU, Linux m68k won't run. Do you know the extensions of the packages
from your cd? Is it something like *.rpm or *.deb, this would hint towards
Linux (*.deb is Debian, *.rpm is RedHat or SuSE).

Regards,

Kerstin

Date: 1999-02-23 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <7au7fq$q0b$1@news2.xs4all.nl>
Source record: 83870

As promised I have read the manual that comes with the MiNT98 CD-ROM
before doing things.

That manual is 56 pages in A6-format (=1/2 A5) with small characters.

The first remarkable thing is: the American Legalistic Worldview
penetrates Europe. Two pages full of (German) legal talk.
I learn that I have paid a lot of money for the compilation work, the
installation programs and the administration software. All other
things are somehow free (but maybe not: 'read the manuals on disk' I
am advised).

I am told that a copy may be made by me for back-up purposes. But in
the next sentence something strange pops up. I will translate as good
as possible:
"The lawfully buy of this distribution allowes for the use on one (1)
computer in one (1) place"
(Der rechtmaessige Erwerb dieser Distribution berechtigt zur Nutzung
auf einem Computer an einem Ort.)

But I want to connect 3 TT's, a Falcon, a 1040 ST and a DOS-Box!!

So I have to buy 4 other MiNT98 distributions?

Then Networking this way becomes really expensive.

But reader, do not be afraid: when Legal Eagles come circling around
the Stichting ST I will review the position. So for the coming time:
I go on!

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST
atarist@xs4all.nl

3403. Re: One of these days... MiNT?

I go on: after reading the first principles of networking (IP,
NFS, Unix, Gateway) from the MiNT98 manual I come to the section 6:
Installation.

There is a nano-distribution. Then I can import drives and do TCP/IP
things (mail, WWW etc.)

There was a question: can I use an 1040 ST in the network and still
do something usefull on it like typing text like this?

Date: 1999-02-23 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <7aud3v$1sl$2@news2.xs4all.nl>
Source record: 83875

Part of message disappeared between here and newsgroup. So here again

>I go on: after reading the first principles of networking (IP,
>NFS, Unix, Gateway) from the MiNT98 manual I come to the section 6:
>Installation.
>
>There is a nano-distribution. Then I can import drives and do TCP/IP
>things (mail, WWW etc.)
>
>-------
>There was a question: can I use an 1040 ST in the network and still
>do something usefull on it like typing text like this?
>-----

The manual says: need 730 kb memory. Because Thing is needed because
of long filenames. But with single-TOS it can be removed from memory
and loaded later from the net.
That gives 450 kb memory extra.

Question: should it be possible to burn the Boot (C:) stuff into
Eprom so boot from cartridge port c is possible?.
Then I would have a no-moving parts very silent network computer!

Met vriendelijke groet,
Ronald van der Kamp

3408. The Ultimate CD Collection

Newsgroup: comp.sys.atari.st
Date: 1999-02-23 00:00:00 UTC
From: dennis.vermeire@ping.be
Message-ID: <7audtq$c19$2@news3.Belgium.EU.net>
Source record: 83876

Hi all,

Is anyone out there interested in this???

PROJECT 1
Over the years I build up a massive collection of PD/shareware, articles, manuals, FAQ etc... We're talking about 10Gbyte here. And the collection keeps growing... so, the last couple of weeks I've been busy categorizing all the stuff, a lot of it can't be found on the net, and what ftp would accept Gigabytes of atari software? not to mention the telephonecosts uploading it.
So, I'm thinking about putting the highlights on a CD. I'm busy writing a nice shell in html, so that it's going to be easy to get to the data.

PROJECT 2
I'm amazed seeing the amount of data I download in one year, it never stops... 400Mb atari stuff. This takes a lot of time and in Europe costs a lot of money too.
So, I've put all the stuff on a CD, all categorized and up to date. Every year I'll burn a new one, so that we always have the latest stuff....

PROJECT 3, 4, 5 etc
-Nothing concrete yet,but I was thinking along the lines of a dedicated MINT CD, where all the tools and apps needed are easy to get at and possibly make it a snap to install, but I'll need the help from a couple of MINT gurus here....
-A dedicated DTP CD loaded with CFN & TTF fonts, pictures, apps, utils and templates
-A MIDI CD covering synths, editors, banks etc. I'll fill the CD to 650MB with MIDI songs.
-For the other projects I'm open to all suggestions.....

Now comes the best part..)))
Price for each CD => ï¿½ 2.00 or 3 Euro, this price also covers postage anywhere on planet earth. The media doesn't cost much and isn't heavy so for this price it's feasable.
I'm not doing this to make any money. It's a service from one Atari fanatic to the other.

I'm open for all suggestions concerning the contents and wanted apps. Let me know what you think and want... If it doesn't fit on one CD, I'll produce a "double album"...

Cheers from Belgium

Dennis

At those prices (what's that, US$6 or so?), yeah, I'd be interested in several of the projects.

What I'd like to see is a "highlight" type disk of programs that run on some minimum type of hardware. How hard would it be to make a 520ST disk, with the best programs that run in 512k, or an ST disk, with the best stuff that runs without needing an STE? The biggest complaint I have about a lot of "ST" resources on the internet are that they do a poor job of letting me know whether a program will actually work on my real ST systems.

Jeff

well if you want to start with X-windows, check out the 7 disk TAF set,
very easy install.
I don't think we sell it any more, but it is available at some ftp
sites.
go to MiNT and look for the TAF distribution.
for example: ftp.fu-berlin.de/atari/mint/contrib-package/taf/
just copy the compressed archives (*.tgz) to floppy disks, the install
program actually decompresses them.
install.txt and install.zip and readme.txt go on the install disk(disk
1). 2a.tgz and 2b.tgz go on disk 2, etc...
this install a mono X-window
good luck.hope this helps

I looked into the new ST Computing magazine (German) and there was
something about Mint98.

First: in a redactional message (News) info from Delta Labs was
reproduced.
I am working with old software because there is a Mint99 now.
Reported are:
1. complete X11
2. languages: PERL HUGE, TLC, GNU C++ 2.8.1
3. complete MiNT TOS
4. MiNTNET
5. Internet Tools: Gopher, WWW, FTP, Telnet, Apache, Webserver, Samba
etc.
6.all MiNT distribution kits
7. FreeMiNT 1.15.0
Further: MiNT course from the Revolution CD Magazine (German)
And a price of DM 59 ($25 about)
Update price DM 29
see http://www.deltalabs.com

Further advertising show me that MiNT 98 costs DM 150 (AG
Computertechnik) and with N.AES DM 249 ($130 about) by Woller Systeme
http://www.woller.com

Also remarkable are prices of hardware.
AG Computertechnik also has Bionet (DMA) for DM 100 what is a good
price but Riebl/PAM VME-bus networkcards are now DM 300.
E-mail: AG_Comtech@omline.de

A year ago I paid DM 99 for a Riebl by BEST Electronics. But he has
sold them out now I was told.

Please readers of this nessage: if someone can explain what all the
new names are like HUGE, Apache, Telnet etc mean, please feel free to
educate the world and me.

Hello Paul

Michael White now owns both Diamond Back and Diamond Edge rights.

He has announced a new version of Back shortly but not of Edge.
Both are going to remain commercial but he has given no details
as yet.

Well, iCab supports Java on the Mac because there is an underlying Java VM (Apple's). Now, if somebody comes up with an Atari Java VM, it should be easy to make it work with CAB...

The newer release of the MiNT '98 distribution CD will have a new name
because there is too much confusion with The Atari MiNT 98 (now 99) CD.
MiNT 99 has NOTHING to do with the MiNT '98 distribution CD.
MiNT 99 holds only the MiNT utilities that can be found on every well
equiped ftp-server. That's all.

>A year ago I paid DM 99 for a Riebl by BEST Electronics. But he has

So it is not related to Eric Smith's comments on use of the mint mailing
list?

"I'm sure that use of
the word 'MiNT' in the output of uname would be acceptable use,
but use of 'MiNT' in a product name (for example) is another matter.
I would check with a lawyer before doing this."

Product name being the name of a CD distribution? <g>

3424. Re: One of these days... MiNT?

Newsgroup: comp.sys.atari.st
Date: 1999-02-23 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <7av4bg$1fl$2@news2.xs4all.nl>
Source record: 83892

After a good night sleep I went on with MiNT.

I remeber that before I shut the TT down that there were a lot of
remarks.
Last on: to transprot folders, set MiNt in Auto-folder.
Because I do not know where these messages are stored (or is there no
log for them?) I wrote down the folder names om paper.

After booting without MiNT I took the folders Mint98 and multitos to
C and also nohog as acc.
That was wrong: as the manual said: "transport by hand Multitos from
Mint98 folder to C:"
Repaired it.

Now the big moment: a restart of MiNT.
Unreadable fast messages scroll the screen.
Control-s does not seem to stop this VT52 screen.
Does anyone have a good way to read those messages?

Because it is needed.
As far as I can see there are syntax errors in the mint.cnf file
signaled.
Where do I find the syntax description of these statements?

->->A normal user would be stuck now.!!!!!!!

But I have on another TT a bit of Mint and can compare those two
files. Maybe with some intelligence I can solve this problem.
And indeed: an error of the install program it seems.
To make the mint.cnf file I think they use a template and there are
placeholders for later constructed statements.
Placeholder like
MODEM1
SER! etc.
The wrong syntax is:
MODEM1sln U:\...\modem1 ....

getting rid of "MODEM1" text solves the problem.
Needed tool: an editor like QED.

After a reboot I see another error in the list: (or maybe not an
error, it disappears too fast from the screen to really see)
"RSVX not loaded". Digging in the manual tells me: needed for
HSModem. But I do not have that. So why needed? Or am I wrong here?

Further fstab is not found. But I remember that I have to setup
things for the net so I do not worrie yet.

Also something about printer not installed.

And the CD-ROM drive cannot be used.
Luckily I know that I should use Spin with MiNT and not MetaDOS fron
CD-Tools. But how many people will know that?

How simple and unknowing should a potential MiNT user be compared to
a Windows user or a MagiC user who has to install the system?

Anyone still reading this newsgroup thread?

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST
atarist@xs4all.nl

Atari 520ST with Color SC1224 Monitor & mouse including:
- 1 Single Density (360K) 3 1/2 inch Atari external floppy drive
with cable
- 1 Double Density (720K) 3 1/2 inch homebrew external floppy drive
with cable
- 1 spare single density (360k) 3 1/2 drive mechanism
(note: I replaced the drive mechanism for one of the single
density drives with a 720k drive to make the homebrew drive and
had to hack the drive case a little...)
- the motherboard is Rev A without the RF modulator output
- original manuals/Basic & LOGO language floppies
- original shipping boxes
- About 50 floppies with downloaded programs/games

Several Atari ST Games/Software in original boxes with manuals:

1) Microsoft Write w/4 floppies (program, GDOS distribution disk,
Gdos fonts/drivers for Epson FX80 and Star Micronics NB15) in
3-ring binder & box2) Jewels of Darkness - by Firebird
3) Universal Military Simulator - Ver 1.3 - by Rainbird
4) The Pawn - by Rainbird
5) Silent Service, the submarine simulation - by Microprose
6) Zork Trilogy - by Infocom
7) Mathtalk - by FirstByte
8) Degas (drawing/art program) - by Batteries Included
9) Flash (telecomm program) - by Antic - Ver 1.1
10) HippoConcept (An outline & idea processor) including HippoArt I

Books:
11) Atari ST Tricks & Tips by Abacus S/W, 1st Edition, (c) 1986
12) Megamax C Language Development System - manual for C compiler
(no disks)

I will consider any offer for any piece, but it must include shipping
if not in local area (Huntsville or Decatur, Alabama)...

Thanks for offering the Nemesis software. I do appreciate it. But I have
already tracked it down, and tied it to a tree on my hard drive. ;)

Right before I e-mailed Titan Designs, I spoke with Alex on the phone
about my Nemesis trouble. I think he installed at least 25 of them for
other folks without any problems. But it had been awhile since he had
fitted one and he didn't have any instructions left to refresh his
memory. He did try to help me and gave me some tips on what to try.
I told him that if I could not get it working that I would probably
send my Falcon/Nemesis to him to check out. I bought a used
FalconSpeed board from him at the same time I bought the Nemesis.
The FalconSpeed board worked great. No problems with it at all.

I wanted to speak with someone at Titan Designs about the problem
I had with the Nemesis. As I stated in the e-mail. My Falcon will not
even boot when the board is installed as the instructions says to do
it. Either there is something missing in the instructions that I don't
know about, my nemesis board is screwed up bad, or my Falcon is
different in someway causing the nemesis not to work right.

I have a question that maybe someone who knows the Falcon motherboard can answer. The MIDI and IKBD ICs as defined in the Nemesis manuals on my Falcon motherboard are the same. When I say the same, I mean all the IC identification numbers and letters and etc are exactly the same on both chips. Is this correct?

Also, I noticed in some of the pictures in the Nemesis manual that there seems to be some componets installed on the Falcon mother board right beside or near to the standard Fan location. My Falcon has places for lots of componets there, soldering pads and etc. But nothing is installed there. Can someone tell me what all those empty place where intended for? And do some Falcons have componets installed there? According to the Nemesis pictures in the manual that Falcon did have some stuff installed in that location. If any one has some technial info on the Falcon mother board. I sure could use any info on it.

And if anyone out there thinks they might could help me figure out why my Nemesis is doing weird stuff then I sure would appreciate any help.

>Any tips?

I've downloaded the pics and had a look....
Never, scan maps like these in color, even a very expensive drum scanner will not be able to get it right. Go for black&white and if the outcome is to harsh, 256 grayscale. Don't use a high dpi setting, it will look much better in 200dpi then when scanned in 400dpi.

I first corrected a green colorhue to about 12%, then converted the pics to 256 grayscale level. Filtered them at 10% to get rid of any unwanted specks&spickles. Raised the brightness with 10%, and put in a red color hue (remember we're in grayscale) which fools the eye in thinking there's a bit more depht ans basically that's it.
The saved pictures are a lot smaller now and that's always a bonus if you want to put them on a website.

In general, it is very hard to scan old maps, mostly because the correlation between the print and paper is not right. 9 times out of 10 the texture of the paper will disturb the picture.

Trick of the trade, put a piece of black carton/paper over your scan and if that's doesn't improve things drastically, give your picture a very strong sepia color correction, they will look exactly like what they really are : old maps with a light brownish color

Gemview is not suited to correct pictures, take a look at PHOTOLINE, IMHO the best photoretouching app on Atari, you can also scan directly in Photoline and correct the pics straight away....

Cheers from Belgium

3429. FS: Big list of Atari stuff

Newsgroup: comp.sys.atari.st
Date: 1999-02-24 00:00:00 UTC
From: Lynn Sturgeon <lynn.sturgeon@juno.com>
Message-ID: <19990224.123552.12959.0.lynn.sturgeon@juno.com>
Source record: 83647

All of this is located near Denver, priority will be given to local buyer so I don't have to box it all up, but if no one local wants it I'm willing to ship, and will ship the small stuff in any event.

7 SC1224 color monitors - $25 each
1 SC124 mono monitor - $25
all monitors include either built-in or separate monitor cable

6 1040 STf's, several have the original box and packing materials - $25 each
1 ST520f, no power brick - $15

3 SF354 external floppies with power bricks and data cables, $10 each, 1 extra brick - $5

1 Megafile 20, drive spins up and sounds ok but I haven't tested it - $30

1 Pyramid Atari Monitor Master, allows you to switch between mono and color monitor easily - $10

1 NewIdea "Beetle Mouse", black with red buttons, new in box - $10

8 Atari STM1 mice - $10 apiece

3 spare floppy cables - $3 apiece

I'm not an Atari person per se, don't use this stuff so I'm not interested in any trades.

Pricing isn't firm, and a bulk offer (especially local!) will be warmly received. Prices do not include shipping costs, if applicable. And if you want any of this stuff, don't wait on it. It's going to go to the Salvation Army or Goodwill if there is no response within a week. Thanks.

Neil, I agree completely, though IMO the problem stems from another
factor: when editing in Newsie, it takes the headers to the editor as
well. Since several people set their editors to 75-80 chars then wrap,
this leads to problems with the headers. Okami and Firenews both don't
send the headers straight into the editor, reason why this is never a
problem with these.

There still are a few things John has to sort out with Newsie: this 50-
character limit (I wasn't aware of that one until now), then the sending
of the headers to the editor when editing and finally the IMO stupid
default setting of "collapse threads" which leads to only more problems
with new users (I had the same problem when I started with Newsie).

I have a few simple questions for all of you.

1) If you could play any of the classic 8 bit games again what would they be. A top 5 would be good.

2) Which characters (i.e. Jet Set Willy) stick most in your mind.

3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make to old games. Would you improve the graphics for instance?

4) Does anyone know who owns the rights to any old games or characters.

Answer back soon

> be. A top 5 would be good.

I'm an Atari person, and I still have multiple Ataris hooked up. So the question "If I could play..." isn't really accurate. Here's what I play most often.

1) Ballblazer, Atari 7800 - Probably the best two player game ever. The 7800 version seems somehow smoother to me than the 800 version, and since it only uses one button, you can use Wico sticks on the 7800.

2) Robotron 2084, Atari 800 - Love this game. I duct tape two Wico sticks to a board to play this thing as it was intended. A couple years ago, when I played a bit more often, I could play as long as I felt like it: the game couldn't kill me.

3) Boulder Dash, Atari 800 - And its followups/clones. Incredible blend of strategy and action.

4) Bruce Lee, Atari 800 - This was an okay game when I first bought it, but when I got to college I found a cracked copy with infinite lives. We'd play this thing for hours: the two player aspect, although not perfect, was pretty cool.

5) Fort Apocalypse, Atari 800 - The sounds helped make this game immersive for me; as immersive as a game could be at that time, I guess.

> 2) Which characters (i.e. Jet Set Willy) stick most in your mind.

I don't remember his name, but the Boulder Dash character who taps his foot at you if you stand around too long still makes me giggle.

> 3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
> to old games. Would you improve the graphics for instance?

For most of the games I like best, I'd like new levels. It's unfotunate, but I have come to associate "improved graphics" with "worse gameplay." Boulder Dash, for instance had terribly clunky graphics, but I could run in and out of streams of falling rocks and diamonds on certain levels: fantastic gameply contol.

> 4) Does anyone know who owns the rights to any old games or characters.

Can't help you here. I maintained the original cross-post list, I hope I haven't offended any non-Atari folks by doing that.

Jeff

|I have a few simple questions for all of you.
|
|1) If you could play any of the classic 8 bit games again what would they
|be. A top 5 would be good.

1. The Nemesis Sage... (Gradius on some systems)
2. Metal Gear/Solid Snake
3. Boulder Dash
4. Zanac-Ex / Aleste
5. Penguin Adventure

|2) Which characters (i.e. Jet Set Willy) stick most in your mind.

1. Metal Gear
2. YS
3. Fray
4. Princess Maker
5. Final Fantasy

|3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
|to old games. Would you improve the graphics for instance?

Nop.. I would keep the games as they are... The GFX and the sound are just
the things that give these games their atmosphere... Maybe tune up the
resultion a bit, but that would be all.. The last MSX games featured over
19000 colours and 9 channel FM/PSG music.. So this was quite good !

|4) Does anyone know who owns the rights to any old games or characters.

Nemesis, Metalgear, Penguin Adventure -> koname http://www.konami.com
Zanac-Ex Compile
YS / FInal Fantasy -> Falcom
Fray / Princess Maker -> Micro Cabbin....

And if you wish to play these games and anjoy them in full glory.. Just go
to: http://www.casema.net/~tfh and download the fMSX emulator together with
these games... All these games (And some 1200 more !!!) can be found online
right here.

FireNEWS does send the headers into the editor, including a quoted copy
of them if so desired (I think this is an option). But it won't limit
individual message IDs to 50 characters like NEWSie does. All this is
unrelated to the problems caused by the editor auto-wrapping things --
the truncation in question is a forced limit by NEWSie, not something
that occurs in the editor itself.

The Arcade games run by mame are usually nice things. It's just a shame
that most of the moe intresting stuf is way to slow to be enjoyable
(even on SA)

Things like Paperboy, Super Sprint, Blasteroids, Road Blaster, Space
Harier etc.. spring to mind

> 2) Which characters (i.e. Jet Set Willy) stick most in your mind.

No particular charactor really...

> 3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
> to old games. Would you improve the graphics for instance?

Those old arcade games like e.g. Super Sprint or Paperboy have on MAME
a decent resulion and colours so I definitly wouldn't change it. The
sounds is cracky but if that would be fixed it'll be alright too.

All I want to see is that these games become enjoyable
(faster/original speed) instead of an old jerky slow representition of
it.

> 4) Does anyone know who owns the rights to any old games or characters.
>

Perhaps the mame ppl can help. Some o/t above mentioned games are
ï¿½Atari but names to remember are Konami, Warner, etc...

On Wed, 24 Feb 1999, Richard Wray wrote:

-)1) If you could play any of the classic 8 bit games again what would they
-)be. A top 5 would be good.

Lots of games (in no particular order).

Quazatron on the Speccie (I nearly wrote a version for the Amiga a few years back, but I lost interest, so I ended up with an isometric map like Quazatron with Robots moving around and the ability to move around it and do nothing else).

Spindizzy (Amstrad version).

Scuba Dive (Speccie version).

NetherWorld (Amstrad).

Uridium, Nemesis, Salamander, etc. (a mix of all those games).

Personal Fave: Times of Lore (C64 / Amstrad).

-)2) Which characters (i.e. Jet Set Willy) stick most in your mind.

None really. Games were the focal point back then, not characters (Lara Croft comes to mind). Of course, monty mole and Roland (CPC only) come to mind, but not to any great extent.

-)3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
-)to old games. Would you improve the graphics for instance?

Of course. Definitely higher resolution and more colours. If these games are to be brought back as near copies of the original for the PC, Acorn, Amiga, etc, then higher resolutions are a must. At least 800x600 for the PC. And a lot of colours! More detailed gfx and more varied gfx come to mind for a lot of games.

Updated sound as well would be cool. No MIDI though, it is worse than a Speccie 48k 1 bit beeper sound. Big fat chunking samples etc.

I saw a '3D' Chuckie Egg last year (looks the same, plays slightly differently :-( ) and that was pretty cool.

-)4) Does anyone know who owns the rights to any old games or characters.

No.

Graham

What type of hard-disk do you have. Some Toshiba ones will not spin with a Nemesis in there, it's not a common fault but Mick Lock (UKL fitter) told me when I had mine done. Nemsis also brutally exposes problems in NVRAM, it did on mine, although the Falcon ran fine it was running as a default system, with a Nemesis in ther eit wouldn'rt even boot...I thought it was my installation, we chased it down to dead NVRAM, replaced it now it's fine and a remarkably stable (CAB goes down occasionally but it always does anyway) system....perservere, it's a great mod. I've never had a problem getting a respons eout of of Dave at Titan either, replies normally within an hour or so of writing during the day....

Hello all:

Right now I am using my Hotmail account for my main Email. My wife
uses our providers. The only thing is that HOTMAIL is NOT Cab
friendly! I can only LOOK at my mail, and cannot email anyone from it.
I CAN email from newSie, but not directly from Hotmail.

My question : Is there a CAB friendly Web Based Free Email ?

Being fair to Ronald he is actually trying to get a new set-up and is coming across some problems not of his making. Judging from his many previous postings he is not stubborn and hostile - quite the opposite!

And definitely not clueless!

He is also very helpful and polite when responding to other's postings ;-)

Kind regards

Mike Kerslake

I did goof, it's the option "collapse threads" option that causes the
followups to be hidden. ;-)

To: TITANWEB@compuserve.com (Titan Designs/BSS)
From: phantomm@eastky.net (Phantom)
Organization: Phantoms Haunt
Subject: Nemesis Troubles
X-Mailer: NEWSie Version 0.92 (Atari)
Status:

Hello Titan Designs/BSS,

About a year ago I purchased a new Nemesis 25/50 from ATY Computers in
the USA. I have had it stored in its box until about a month ago when
I finally got around to installing it in my Tos 4.04/14meg 72pin Falcon
030.

Before I attempted the installation, I read the original manual and
the updated manual (from your Web site) many times. After I understood
what needed to be done exactly I started the installation.

The Buffer installation went fine, no problems there.
I used the inductor from L102.

However, I have had strange problems with the Nemesis installation.
The Midi and IKBD modifications is where the trouble starts.

After fitting the Nemesis card, proper grounding connections,
preforming the modifications to the MIDI and IKBD, connecting all
wires to there proper connections as the manuals state. I then
tried the First Nemesis Test.

The results....

I turned on the Falcon, the Fan runs, the IDE drive does not. The Ide
drive would not spin up or make any sound at all. I got a white
flash from the monitor, then nothing not even a black screen.

I then removed the white wire from the temporary ground, leaving it
not connected to anything at all. Everything else is as the manuals
state. Booted the Falcon....

Fan runs, IDE drive spins up, the 17' SVGA monitor gives a black
display.

Over a period of a week, I carefully tried re-installing the Nemesis
following the instructions exactly. My Falcon will not boot at all
if I follow the manuals. The IDE drive won't even power on!

I tried many different things and took notes but I could never get the
Nemesis to work right. I can't get passed the First Nemesis Test.

So after many hard hours, I removed the Nemesis, and reversed all the
modifications except for the Buffer, for the 4 or 5th time.

My Falcon runs and works fine, just like it always has. I did leave the
Buffer installed. Not sure if it gives any benefit without the Nemesis?

Can you tell me what the problem with the Nemesis is from what I have
described?
If there are any other details I can give that might help
you determine the problem then let me know.

If you cannot, Can I return the Nemesis card to you for repair or
replacement?

I spent good money on it and would like to have a working one. If there is
something I can do to test the Nemesis card other than the installation
instructions then please let me know.

Also, Months back I sent my original Apex Media disks to Systems For
Tomorrow along with payment for the latest Apex upgrade. It is my
understanding that SFT were to send the disks to you for the upgrade.

Was wondering if you had indeed received the disks and if so, have they
been upgraded and sent back to SFT yet?

Regards,
phantomm@eastky.net

End of e-mail

Good thing I keep copies of everything. :)

A copy of this e-mail was also sent to Titan Designs Technical e-mail
address about a week later.

I never got any type of a reply to this e-mail.

I have contacted Systems For Tommorrow several times in regards to my
Apex Media Disks. SFT always seems to try and help find out what the
delay is by sending e-mail to Titan. I contacted SFT today and the
disks still have not arrived. I have no idea what the problem is.

If anyone from Systems For Tommorrow wants to comment on this then
please feel free to do so. :)

Also, When I first received the Nemesis package from ATY Computers
the Nemesis software disk was bad. I sent the damaged disk to
Computer Direct in Canada for a replacement which never got replaced
and no answer to e-mail from them either.

So as it stands, I am Nemesisless, Apexless, penniless, and
not even a brief note as to why.

I have exchanged e-mail with David in the past and even called him
on the phone several times when I ordered replacements ICs for
my Expose Splitter. I did get those and they work quite well.

If Titan Designs does create some nice boards for the Falcon
I would have been more than happy to purchase them.
But I do think I should expect a little more communication
when I, a customer have a problem with one of their products.

No reserve, for a picture or to bid:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=69393982

This is a lot of six boxed software for the Atari ST line of computers. The following are the titles and contents of the packages:

Falcon by Spectum Holobyte with box and manual. F-16A Falcon air combat simulator.

Arena by Psygnosis with box and manual. Decathlon type of game.

Jet by Sublogic with box and manual. Jet fighter combat simulator.

Backup by MichTron with box and manual. Hard Drive to floppy disk backup program.

Stereo CAD-3D 2.0 by Cyber Studio with binder and manual. 3-D animation program. Also includes Cybermate, an animation program.

Word Writer by Timeworks with box and manual. Word processing program.

Police Quest 2 with box. Missing disk 2 (out of 3), I'm just throwing this in the package instead of throwing it away.

Good luck!

Hi Phantom,

If you still don't have the Nemesis software, I can offer to email it to you. I would think there should be no problem with this, as you have already paid for it. Maybe you'll have no need for it anyway. :-(I got my Nemesis from CompDirect, but had Alex at ATY install it. (The installation looked pretty complicated, and I am rather soldering-impaired.) I'm happy to say that Alex did good job installing it and also did all of the Steinberg recommended audio mods. Why don't you send your Falcon to Alex? Maybe he could figure out what's wrong. I think he has done many Nemmmy installs.

I have had good success with contacting Titan-BSS, with prompt replies.

Good luck,

Clayton Murray

Good then I am free to reply here without threat of civil action.
I will translate what he really is saying:-).

Translation of the above paragraph!

I am only here for my own personal need.
1) Either to sell you something
2) To get help for my own personal problems
2a) This being a silly game.
Because the request is so important and my time is very precious, I will not read posts in this newsgroup. I don't wish to have information shared with any other people who are active in this NG.
3) I have been around along time and don't want to read this group anymore because there is little of interest here for me. Not even my own post is worthy of my time to come and read. Therefore just email me so I don't have to waste valuable time with the Atari users in comp.sys.atari.st.
4) Don't forget to buy my stuff.

>Hello, I'm looking for help with the Game SunDog. I'm looking for a
>completely broken copy of SunDog, without copy protection. And for your
>information I do own a legitimate copy, with Manual and box.

Translation:
And then after playing this game, actually after 14 years of playing Sundog and nearly getting to the end, I wrecked the disk. However with your help I can repair this disk and sell it to you from my own stock in another 7 years.

>I want the
>Atari ST version, not a version converted to run on a PC emulating an
>Atari ST. One of the disadvantages of running a copy protected version
>of SunDog is the Copy Protection. Backups of SunDog are prone to fail.

Translation:
All disks are prone to fail, but at this particular moment they are MY DISKS that are failing, and therefore this is very very important. Please help me now!

>In fact, I've been told, that the copy protection was so good that some
>factory originals would fail. Another problem is if your disk failed,
>your saved game on the disk would be lost. Also, I'd like to be able to
>have more than one copy of the same saved game. Does anyone know where

>I can get this?

Translation: I am afraid to lose the original disk to failure for when I get
a chance to play it. I don't want to use the original. I want you to buy
it from me.

Answer to last Question:
I believe this is referred to as the mysterious BLANK disk. Comes in a Pack
of TEN and you can save a game to each disk. Just Like Dungeon Master.

All the above is of course tongue in cheek.
I just see some irony in all this.

Regardless I have had bad disks and missing disks, and also disks with no
manual and the people here have been great to me in getting my software
sorted out.

Notably:
1) A WordPerfect 1991 update.
2) APEX MEDIA fix to my second disk.

and I have supplied fixes to other peoples disks as well in return.

But really, I think it is somewhat polite that you spend some time on the
Newsgroup and try to help others out all the same, and just not use it
strictly for your own personal needs, regardless of your legitimacy.

I have taken people for their word as owners of a certain software, and
they have taken my word. If you find you self willing to help out another
there is little else you can do but take their word for it. But in the end
I think whether people help you out or not is not based on whether you
own a piece of software. That is only 50% of what is required.

A legal answer would be to "contact the manufacturer".
Har har. We all know that this isn't really possible in many cases.
Therefore we have to help out each other whenever possible.

It is a two way street Ben. If you do not read this NG, I don't believe
you are able to help others. Unless if someone stated they had a defective
disk of say "Balance of Power 1990". What would your answer be?
A) I have one for sale for $5.00 that you can buy from me?
B) I will give you a pirate/hacked version for free directly email.

Signed
Brian Van Tilborg

You can buy Diamond Edge from Hisoft.

http://www.hisoft.co.uk

Take a look in the Atari Bargins section. You will find Diamond Edge
(and Diamond Back) available for 15UKP each.

Minix filesystem is definitely not necessary. The internal harddisk of my TT
is for use with MagiC 5.4. It has the VFAT filesystem. Linux is installed on
an external changeable Syquest medium. To start the Linux bootup procedure I
doubleclick bootstrap.ttp while MagiC is running and this ttp loads the
Linux kernel. ... and the kernel is located on the internal HD in partition
C. I have not a single minix-partition, although it might be useful to
exchange data. You can't read ext2fs with MagiC, but Linux can mount VFAT.

Here is another attempt to find out about your system:

Type the following command

uname -a

What does it say?
(I hope that command has been installed. The system should identify itself,
telling you installation date, kernel release and things like that.)

> My Falcon does have an FPU. As for extensions, the CD I'm using is the
> Floppyshop Falcon compilation. The files have extension .TAR mostly, which is
> the archival format.

Tar is common in the unix world ... so this is not really informative.

Besides that, can you give a description what your directory tree looks
alike? Do you have any idea where the kernel of your system is located? If
it is Linux, it should be named linux-something.gz or vmlinuz or similar.
You know the basic commands e.g. cd for change directory?

The directory tree from top level should show the following directories in
Linux:

bin dev boot root etc proc var mnt

and others ...

Regards,

Kerstin

> adresses that the machines use to deliver the packets.

They're message IDs used for threading purposes (among other things). MacSOUP uses a graphical threading tree, so any time the references get trashed the problem is always more apparent.

As a former NEWSie user, I used to rebuild the trashed references while composing in qed. At the time, as mentioned, I reported the 50-character limit to John, obviously to no avail. His reason for not increasing the character limit escapes me now, although if I remember correctly it had something to do with memory.

There's no reason a newsreader should, in some instances, leave behind a trail of broken references -- Okami and FireNEWS certainly don't. Some might call this problem insignificant but I disagree.

To illustrate the truncation, do a test followup to one of Katherine Ellis' posts. For example, her recent ATARI COMPUTING post has the following Message-ID (and future 'References' entry when someone does a followup):

<Pine.BSI.4.05L.9902222151030.26517-100000@users.southeast.net>

Or, instead, take a look at the followups to this same ATARI COMPUTING thread: you'll see what NEWSie has wrought.

Years ago I used to get this error periodically with floppies used in my
Mega 2's external Atari drive (this based on what Disk Mechanic reported).
From what I remember, looking at the floppy's directory with DM's editor,
I'd always see a single random character in an unused section of the
directory. Restoring that character to its normal 'unused' value and
resaving the track or sector (whatever it was) made the checksum match
again, fixing an otherwise inaccessible disk. The random character
obviously got inserted without the checksum being updated.

This plagued me for over two years, having rescued about 20 floppies in
such a manner. Disk Mechanic was the only utility that saved my butt. Why
it occured on somewhat of a consistent basis I'll never know.

John

When does it crash? On Startup or when browsing?

CAB is not the most stable of applications. I just messed around with the loading order of the Auto folder and ACCs until it seemed to crash less. I also used the standard system font instead of any TrueType fonts.

James

You might need to edit each individual object in the mixer map to be sure the outputs are all set to "DSP"

Also, be sure to use the latest versions of CAF and the mixer maps.

> they be. A top 5 would be good.

Does it count if I didn't actually stop playing them...? =-)

Okay, top five time, assume C64 for all of 'em...

1. Armalyte (Thalamus)
2. IO (Firebird)
3. Turrican 2 (Rainbow Arts)
4. Enforcer (Double Density)
5. Delta (Thalamus)

Briggsy:
> NetherWorld (Amstrad).

Nah, C64. 50FPS and that kick arse digi assisted tune on the titles.
=-)

Richard Wray:
> Which characters (i.e. Jet Set Willy) stick most in your mind.

Briggsy:
> None really. Games were the focal point back then, not characters
> (Lara Croft comes to mind). Of course, monty mole and Roland (CPC
> only) come to mind, but not to any great extent.

What about that ****ing egg? I may hate his yolk but Dizzy was a known
on most formats...

Richard Wray:
> 3) Forgetting 3d, Playstations, N64's and PC's, what updates would you
> make to old games. Would you improve the graphics for instance?

Briggsy:

As an aside, Andy Roberts is doing a version of Mayhem in Monsterland
for the PC... =-)

> Updated sound as well would be cool. No MIDI though, it is worse than
> a Speccie 48k 1 bit beeper sound. Big fat chunking samples etc.

[Points at Briggsy]
With him, Screamtracker sound support, please. =-)

Richard Wray:
> 4) Does anyone know who owns the rights to any old games or
> characters.

Briggsy:
> No.

In most cases the characters are still owned by the companies in
question, Monty and Thing belong to Gremlin, Dizzy to the Codies...

But as for the copyrights on the games themselves, it gets *very*
complex in some cases... =-(

The problem with these HTML emailer is that you need to have a browser which understands javascript. The viewing part for the email is just normal HTML pages. The editing part, requires javascript and if you uses it's address book or upload attachment, it requires Java as well. Since Javascript don't run on CAB, you cannot reply using Hotmail, but you can view the emails.

BTW, why don't change to another free email account like yahoo mail. Hotmail is owned by Micro$oft.

Lets see (C64 unless mentioned):

1)Paradroid
2)Tornado Low Level (Spectrum)
3)Crazy Comets
4)Sanxion (for the Rob Hubbard music!!!)
5)Creatures II

>>Richard
>> Which characters (i.e. Jet Set Willy) stick most in your mind.
Clyde from Creatures, Rockford from Boulderdash, Rick Dangerous (the
guy that really spawned Tomb Raider...)

>Richard Wray:
>> 3) Forgetting 3d, Playstations, N64's and PC's, what updates would you
>> make to old games. Would you improve the graphics for instance?
In the case of Paradroid, differing ship layouts for each ship, but
for other games, just new levels, or graphics
>
>As an aside, Andy Roberts is doing a version of Mayhem in Monsterland
>for the PC... =-)
Jason, anything else on this????

>Richard Wray:

Format a double density disk with your PC, copy the files on it, and
read the files with the ST. That's what I do.

Alternatively, use Ghostlink which adds the PC's devices as ST devices.

Hi, Thanks very much for both your replies on this topic. They were perhaps not as clear-cut as I had hoped. In my case this prob does not occur frequently. With one particular disk it happens and the supplier has maintained that the problem is due to the disk drive heads and not the floppy. It's difficult to accept this because most of the other disks are OK.

-)> a Speccie 48k 1 bit beeper sound. Big fat chunking samples etc.

Except for the really good games (i.e. the later ones). I forgot to point that out. Also those MSX2+ games which look pretty good, except I cannot get fMSX to work under Linux, (well it works, and then it cacks up). But those old 2 colour spectrum games and lo-res CPC + C64 games would like a nice resolution boost, and colour boost! Remember what a lo-res game looks like on a modern PC monitor (argh!). Of course if these games were to be produced for something that displayed on a TV, then the resolution is not a worry.

Shame that there are so many great old 8bit games out there that could be ported to more modern systems, but there isn't the time. I suppose writing them now would be easier though, less constraints (like memory, speed) to worry about, so straight C and standard sprite libraries should suffice. Still need graphics and sound artists though!

-)[Points at Briggsy]
-)With him, Screamtracker sound support, please. =-)

Yay! You have agreed with me for once!

No Prehistorik 2 has the title (although Fluff was excellent too) by the way, I have finnally found a way of getting Prehistorik 2 & Super Cauldron on to 3" disc from the dsk images on the web, here goes...

1. Down load the images, play them on the Emulator no probs,
2. get your CPC/Plus COPY MOD'ed
3. Buy Xexor v2.6
4. Copy .DSK's to 3.5" floppies with CPDWRITE.EXE
5. Buy a 3.5" floppy drive for you CPC/Plus
6. Backup from B to A using Xexor with the commands D B,A [Enter] BACKUP Q [Enter]
7. load the game on CPC/Plus from drive A

>be. A top 5 would be good.

Metal Gear (MSX, Konami co., Ltd / www.konami.com)
Ancient Ys Saga (Part 1 and 2 that is, MSX, Nihon Falcom co. /
www.falcom.com)
JetPac (Spectrum, Ultimate games)
RuneMaster (MSX, Compile co., japan / www.compile.co.jp)
Daiva IV (MSX, T&E Soft)

>2) Which characters (i.e. Jet Set Willy) stick most in your mind.

Solid Snake (metal gear series)
Adol Kristin, Lilia (Ys series)
Latok, Fray, Pixie (Xak Series)
Joe Kowalski (Blow Up)
The Konami Penguin (Antarctic adventure, penguin adventure, parodius)
The Snatcher Cast (Snatcher, SD Snatcher)

>3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
>to old games. Would you improve the graphics for instance?

Yep I would, I read some comments that it would ruin the atmosphere in
the games, mmmm if you do it well you won't......imagine the old Metal
Gear with higher resolution and real time lighting effects.....I would
boost the sound too...

>4) Does anyone know who owns the rights to any old games or characters.

In most cases the rights on characters are owned by either the
publisher or the developer.....Like most people would say Crash
Bandicoot is owned by SCEA, which isn't true....Crash is legal
property of Naughty Dog Inc. (LA). Anyway, most companies that made
the classics are still in bussiness....and so they will still have the
rights to both the games as the characters. The only exceptions I know
are T&E Soft, which doesn't exist anymore, Ultimate games, they
changed there name to Rareware Ltd. in 1986, dunno if they kept the
rights on their older games (JetPac, KnightLore, Alien-8)

Compile went bankrupt, but restarted half a year later....and since
they are making a new Puyo game I would say they still have their
rights.....and T&E Soft was a Matsishita company....not sure who owned
the rights to their games.....

>Answer back soon

Hope that was of any help.....open for further questions

>
I've seen several replies to my posting on Y2K, with differing views
on the source(s) of the problems in setting the year 2000 (or 00) and
making it "stick". So I tried a few things on my TOS 2.06 STE.
Disabled all programs which normally get/set the date & time in my
"ICD AdSCSI Plus" disk controller; removed all accessories especially
Control Panel. Then tried setting the date with XBIOS commnad "settime"
and reading it back with "gettime".
These experiments seem to confirm my view that the keyboard clock
(Motorola 6301) at least in my 1991 vintage STE does not allow the
year 2000 to be set. The hex value for the high word sent to/received
from the Intelligent Keyboard Controller is 2601 for 1/1/1999;
it should be 2801 for 1/1/2000.

Any further sugestions?

In order to get dual sticks on the 7800, I took apart two standard 2600 sticks and reversed up and down. Then, I hold the base of each stick in one hand and put the top of the stick on the floor or whatever I'm sitting on. Carpet or upholstery works best.

You can try it without modifying the controllers to see what I mean, but when I did this, I just couldn't reverse up and down in my brain no matter how hard I tried. (I even tried thinking of my little man as a gun site and pretended I was flying a plane, but then his shots seemed like they were coming toward me!) Oh well.

Don't laugh (at least, not too hard) until you try it!

I've seen this, but I hesitated. I don't like the PSX game pads much, I use the Dual Shock which has an almost joystick-y feel to it. But the Robotron PSX package I saw said it wouldn't work with the Dual Shock.

Can you run/shoot diagonally? That's my beef with the MAME version, it's REAL hard to do that.

Jeff

Hi,

Now this question really has got me thinking!

What 8bit game did I really enjoy and still play, other than my top 5 listed earlier in this thread here is a list of other titles that just missed out on the CPC/Plus....

Rainbow Islands,
Klax,
Super Tetris (P.D.),
Nigel Mansells World Championship
Continental Circuis
Titus the Fox (The first game to really show how good CPC grafix cood look)
The Blues Brothers
Hudson Hawk
Switchblade (Cartridge)
Stryker in the Crypts of trojan

The list goes on for ever!!

Thanx

Craig

Yep, no problem. Diagonals for both directions and shooting are pretty
easy with the layout of the PSX pad, I find. I certainly don't have
any problem with it.

3505. st or falcon030?

Newsgroup: comp.sys.atari.st
Date: 1999-02-25 00:00:00 UTC
From: Ryder Jerew <ryder@dreamscape.com>
Message-ID: <36D57A71.2CBD@dreamscape.com>
Source record: 83692

howdy folks.

i'm an avid macintosh user, i want to get into "atari" computing.
mainly i'm interested in the demo/music scene, it looks like there's
quite a big following when it comes to atari coders/demo makers.

i'm just wondering what the ideal atari system would be... i mean if i
wanna do stuff with midi and such, would the st be better suited for
this?

i know the st can be modded to use a hard disk, can the same type of
thing be done with a falcon?

it sounds like the falcon is a faster system? are there any other major
differences?

any info someone could provide would be very helpful.

send me mail directly @ ryder@dreamscape.com

thanks.

I've been told there are a few IEEE-488 (GPIB) cartridge-port interfaces available for the Atari ST from the group that was making them here a few years ago.

If you have a genuine need for one, you can send an e-mail note to "vivitro@horizon.bc.ca" describing how you intend to use it and how you will cover the shipping cost.

3508. NVDI probs

Newsgroup: comp.sys.atari.st
Date: 1999-02-25 00:00:00 UTC
From: paul_mc@atariste.freeserve.co.uk
Message-ID: <7b43l8biu1@news5.svr.pol.co.uk>
Source record: 83745

Hi ,

I've recently reinstalled NVDI and have noticed one or two annoying
happenings to do with fonts.

When I boot up my computer my Ease desktop now uses the
system font this is also the case when bringing up directorys
which are also also in system font.

I do recall using a Dutch font for such purposes as it was the only
font which I could use to display directories the other sppedo
fonts were garbled (althrough they worked fine in atari works)

However there is no sign of Dutch when I reinstalled NVDI.

This doesn't explain through why my Ease desktop is now in system ,
becasue it had a different font before I installed NVDI.

It's all very confusing.

Any input would be much appreciated,

Cheers

Paul Mac

I'm not much help here (only to put my 2 cents in) but I've had
Toshiba xm-5401ta3605 running on my Falcon since '95 with Extendos & ICD.
I can't seem to configure HDDRIVER 7 to access the drive without
Extendos, therefore, I'm running both HDDRIVER 7 and Extendos Gold, for now,
successfully (without ICD/although I miss all those packaged programs
that need ICDBOOT to function).

>doubleclick bootstrap.ttp while MagiC is running and this ttp loads the

Another trick for booting two differents OSses:

Internal drive TT SCSI ID =1
External Syquest SCSI =0
HD driver on Syquest disk: gives boot from ID0, HDDriver loads and
finds 'partition asignment' SCSI 0 =C and SCSI 1 = F if Syquest
diskcontains 3 partitions. Same for HDdriver on ID1 but with Part.
assign as SCSI0= H and SCSI1=C (if on the internal HD are 5
partitions.
Booting with no or non-bootable disk in Syquest gives me 'normal
system' and with my bootable MiNT-disk a MiNT setup.
I use it for MiNT.
Maybe one can also use it for Linux?

From: atarist@xs4all.nl
Message-ID: <7b4914$p95$3@news2.xs4all.nl>
Source record: 83751

Today I go te recapitilate what is reached now.

I plan to connect 3 TT's with MintNet.
The first installation is done, succesfully in the end I suppose.

but there is doubt. From the fast scrolling messages I distill that
something is not as it should be.

I look again in the manual and see that for PAK/3 I need to start the
HS Modem stuff before MiNT. Otherwise you get bombs. I do not get
bombs I (remember: I am a stupid simple user only) and what PAK/3 is
I do not know so it stands to reason that I do not have that.

So should I set the HS Modem in my case after MiNT in the auto-folder?

I doubt it, because a short while ago when the manual told me to put
the MiNT kernel in my auto-folder - again something strange for a
simple user: what is the MiNT Kernel? Has it a colour? - I had a
decision to make.

The manual told me that if I had a Milan I should use the kernel from
\milan\auto\mintnp.prg.
That gives me answer to a question: bringing the MiNt Kernel to the
auto-folder was: put P:\archive\medium\auto\mintnp.prg to my c:\auto\

But to return from where I lost the thread: in that folder \auto
where my version of mintnp.prg was there was also another program:
rsvx.prg.
I took that also to my auto-folder, seemed logically at that moment.
Further study in the manuals on the disk learn me that rsvx is for
bringing the funcionality of HSModem over to MiNT. So should HSModem
stuff and rsvx be before MiNT in the Auto-folder?
Maybe I will find out later but maybe not because I do not plan to
use the serial ports at all on this machine.

Still not happy I go reading the manual of HSModem. The read.me tells
me what parts of HSModem I need for the TT. So that's ok now. I go
further in the manuals and becau it is clear to me now that drvin.prg
is the big boss managing the other parts, I read drvin manual.
And there I find something metioned about MiNT!!!!
"If DRVIN and the drivers are started before MiNT only a little of
the functions will remain...."
Concluding that the are to be started after MINT but that switching
of AUX is a no-go. What is that about?
And the text follows with "no special versions for MiNT are to be
released".

Another point: when installing this package a lot of things are taken for granted, I count:
1. I need an editor like QED for re-editing the mint.cnf file because of syntax errors. (and also because this editor knows about unix-like end-of-line symbols in text files).
What brings me to the next:
2. when the manual told me that I had to take the driver for my ethernet hardware from the right place in folder bla bla to its place (Grrr... what is 'his place? in \multitos\ or in \multitos\devices?)
I took a look at the manual that comes with biodma.prg. I could not read that manual on the screen : taking the 'show' from 'show' print' 'cancel' of normal TOS gives all the letters streaming on the right side of the screen.
I know: it is the end-of line.
But is there damage or user-unfriendliness to give those files normal end of lines? May be that is not done in Unix-land but remember: I am not MinTing, I am only setting up a network for normal TOS machines!
I need a viewer for those texts.
3. the manual indeed tells me that I can put all the stuff I need for my set-up on my harddisks. Takes about 40 Mb they say. But I have not that much space left with the 40 needed for the MiNTNet installation.
Result: I needed SPIN to get the CD-ROM drive spinning again.
Would need that later on in any case so..
4. I have to take care of the order of programs in the auto-folder. Lucky me that I am not a simple user and have XBoot. If not, re-ordering the auto-folder could become a hassle.

A last point and that is the end for today.:::
I go searching on my floppydisks for AUTOMORE, a program that allowes me to split all output to the VT52 screen into a file. Then I will know what the disappearing messages on the screen contain for info.

Met vriendelijke groet,
Ronald van der Kamp

The Falcon is definitely your choice. Have a look at SoftJee's homepage (can't remember the URL, look it up at AltaVista) to get an idea of what kind of software you can get for this machine.

> i know the st can be modded to use a hard disk, can the same type of

The Falcon usually has a built-in IDE-disk, you can also connect standard SCSI-disks to it.

> it sounds like the falcon is a faster system? are there any other major
> differences?

16-bit stereo-sound, direct-to-disk recording, DSP (all DMA), better graphics, faster CPU, optional FPU, built-in IDE- and SCSI-interfaces...

This would be great! The Red Hat Linux idea, where you get a neatly packaged, easily installed OS on a CD, would be a VERY welcome import to MiNT. I keep thinking about putting up a MiNT ZIP, but find myself discouraged by stories of
installation woes
poor installation process
out of date core package

>-A dedicated DTP CD loaded with CFN & TTF fonts, pictures, apps,
>utils and templates

I'd go for this, too. Don't omit Bitmap GDOS stuff, though.

Agreed. When I emailed David asking why ATY had not received any more
Nemesis to sell, he promptly replied that he was out of stock and that he
would only restock when demand made a production run of 100 or so
cost-effective. Fair enough. However, when I then sent a second mail asking
when that might be, I got silence. I do not like silence.

On the postitive side, Titan Designs is responsible for many good things
Atariwise -- sure wish I could get a Nemesis running inside MY Falcon.

Hi Chris,

I have a Western Digital 2.5 (notebook) 540meg IDE.
It may actually be labeled as a EIDE. Not sure what the
differences between a IDE and EIDE are. If the model
number is needed, then I can look for the tech sheet
to supply it.
My Falcon came with a Conner 85meg IDE. I still have it
and it works, I just bought the 540meg for more storage
space.
To get the WD drive working I used the Atari hard drive
software that came with my Falcon to format and partition it.
Ataris hard drive software did recognize this drive.
I had HD Driver version 6 at the time, but I don't think
it would recongnize the drive until I used the Atari
hard drive software to set it up. After getting the
drive formatted and partitioned I then installed HD Driver 6
and have had no problems with it or my other SCSI drives.

Now I have heard that you don't have to format new hard
drives only partition them on Ataris. I'm not really sure
on this. I have always been lead to believe that they need
to be formatted first. I have always formatted any new drives
that I use and have never had a hard drive crash on me.
Some programs seem to fragment files more than others.
Oasis 1.35E and Newsie have always fragmented files bad
on my system any way. I use Diamond Edge version 1.10
(think thats the version) and it always takes care of
any problems.

Getting back to the Nemesis problem...
This is the first time I have heard of possible problems
with a IDE hard drive and Nemesis.

I tried different things with the Nemesis board installation.
The only way I could get the Falcon to boot and get the Atari
logo during the MIDI and IKBD modifications was to connect
L102 together with a wire. Connect pin 4 on the IKBD chip
back to its normal connection. Put the purple wire across
pins 3 and 4 of the IKBD chip.

This was with the MIDI pins 3 and 4 cut and lifted with a
purple wire connected across them.

I did not have the white or black, grey or yellow wire connected
to any thing. The Falcon would boot up all the way to the desktop.
But after the desktop came up, I would get very Fast key clicks and
the mouse movement would skip across the screen.

I also tried this with the white and black wire connected to ground.
But the key clicks came on very fast at my bootup manager and I could
not bypass it to get to the desktop.

If I put the purple wire on pin 3 of the IKBD chip only and left pin 4
connected to its original connection. Put the yellow wire on L102 and
left L102 connected with a wire. The Falcon would boot up but I would
not have any keyboard. No key clicks or anything. This would happen
with the white and black wire connected to ground or not connected to
ground.

Again, during the MIDI and IKBD modification patches I followed the
instructions to the letter and was very careful when doing the mods
and connecting all the wires to the proper places to preform the first
Nemesis Test -The Keyboard Patch.
The Falcons fan was left in the standard place. When I would turn
the power on to the Falcon, the Fan would run, the IDE drive would
not power on. I would get a white flash from the SVGA monitor, then
the monitors self test screen would come on.

I used the inductor from L102 for the DMA Patch for the buffer
modification. This DMA Patch was revised for the 25/50 Nemesis
according to the small Nemesis addendum that came with my
Nemesis package. I did the buffer modification first and it seems
alright. It is still in my Falcon, And I have no problems at all
with the Falcon now.

As for the NVRAM, maybe this is the problem? I have never done
anything to the Falcons NVRAM settings before the Nemesis
installation attempt. However about a week ago I did use a program
to set the NVRAM to let the Falcon bootup in 80 columns VGA mode.

How can I be sure that my NVRAM is alright? Is there a program I can
use to check it out?

And where is the NVRAM located on the motherboard?
Is it easy to replace if damaged?

I really could use some techinal info on the Falcons motherboard.
Is there any documentation available that describes what is what
on the Falcon mother board?
I have heard that there are some differences in the designs of some
Falcons. Are there any documentation available that describes mother
board revisions and etc?

And help with any of this from anyone is greatly appreciated.

Software authors are welcome to protect their software. Ironically, you are
entitled to try to break such protection (in most cases) provided you have a
license (legal copy) of Sundog. However, what you are asking for is if
someone else could send you THEIR cracked copy of Sundog. I find such
behavior from someone who sells software most unusual. I will not aid such a
search.

> OK.

Well, the problem could be due to the drive heads. The Mega I mentioned
had two floppy drives, and only the external drive -- a brand-new Atari
SF354 -- was prone to these nasty checksum errors. What's strange is that
the person I eventually sold it to never had this problem.

BTW, I tried various brands of floppies but it didn't make any difference.

Per the Nemesis manual, there are some Falcons that cannot be accelerated, but hopefully this is not the case with yours. If you have the 50 MHz oscillator, the manual addendum states that it will not work at all without removing the oscillators.
>

I asked David about this, and he explained that the european Falcons
used all the electronics pictured in that location instead of an
oscillator, but that in US models all that was replaced by an
oscillator.

>this?

the ST is well suited to use MIDI. If you want to get into hard
disk recording or sampling, however, the Falcon would be the better
machine to get ahold of, due to its DSP and microphone input ports.

>
>i know the st can be modded to use a hard disk, can the same type of
>thing be done with a falcon?

the Falcon comes complete with both an internal IDE host (for
connecting 2 1/2" notebook drives, although with an adapter cable it is
possible with some fiddling to install a 3 1/2" IDE drive) and a SCSI-2
external host.

2.Ancient Ys saga (1+2) (MSX)
3.Bosconian (MSX)
4.JetPac (Spectrum)
5.Runemaster

>2) Which characters (i.e. Jet Set Willy) stick most in your mind.

Well I do remember Jet Set Willy....but not really a guy with
character....so I would me thinking more about :

Latok, Fray and Pixie (from the Xak RPG series)
Adol Kristin, Lilia (from the Ys series)
Joe Kowalski (Blow up!)
Solid Snake (Metal gear series)

>3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
>to old games. Would you improve the graphics for instance?

Yes I would, change the graphics, but carefully not to harm the
original atmosphere those games had....imagine what the original Metal
Gear would look like with a higher resolution and lighting effects.
And I would change the sounds too....

>4) Does anyone know who owns the rights to any old games or characters.

Well depends on which characters you are talking about, most
characters are still owned by the companies who developed them.

All characters from the XaK series (like Latok, Fray, Pixie) are
property of Micro Cabin co.,Ltd japan (www.microcabin.co.jp)

All characters from the Ys series (like Adol & Lilia) are property of
Nihon Falcom co., Japan (www.falcom.com)

Solid Snake is property of Konami co., Ltd Japan (www.konami.com)

JetPac is property of Ultimate Games PLC, which doesn't exist any more, but I suspect the game & characters are now property of the company that once WAS Ultimate Gaming, namely Rare Ware UK.

And RuneMaster didn't really have any specific characters, but the games from Compile are still property of Compile Co., A lot of ppl seem to think they went bankrupt (and they did) but they made a new start....

>Answer back soon

If there are things about old games or characters you would like to know from the legal owners, I could ask the contacts I have with those companies how things are....just lemme know.

Only the MSX1 had some popularity in the UK, Konami even had a UK development team back then (In Devon) but the only game they made (Green Barret) wasnt really impressive....a lot of UK based Publishers however wee active on MSX...like Gremlin (Avenger) US Gold, Grandslam, Domark (now branch of Eidos) and Ultimate Games (Knightlore, Alien-8)

I had a Spectrum too, but the games weren't really like anything the MSX had.....although I loved jetPac, Jet Set Willy, Cookie, Pssst and many others.

>sheeeeesh, when did ya buy that TV? In 1938? hehehehe NTSC rules

No. 1995 surprisingly. I didn't have a Playstation at the time, so
I wasn't specifically looking for a 60Hz compatible TV, and I didn't
end up with one. It's an excellent TV but it won't sync to 60Hz.

Anyhow, PAL's a better TV system than NTSC, with higher definition
and much better colour, it's just the 50Hz refresh rate that's the problem
when developers do shoddy game conversions.

Thankfully Konami have spent the time well on Metal Gear Solid, judging
by the four area demo I've played (it stopped after you'd talked to
the DARPA chief), as it runs full screen with no slowdown.

I've got CAB 2.5, well sort of. I've got the manual, but can't find the
disks ... I do remember last time I tried to install it, the
installation program kept crashing :-(

At the moment CAB 1.5 crashes every time with 3 bombs. The STE then has
to be reset. Surely it should work some of the time.

Cheers
John

> re-configure HDDRIVER successfully (no ICDBOOT).

HDDRIVER is not a CD-ROM driver but a hard disk driver. You need a
CD-ROM driver to access CD-ROMs. HDDRIVER supports a generic SCSI/ATAPI
interface that enables other drivers (e. g. CD-ROM driver, scanner
drivers, streamer drivers) to access SCSI/ATAPI peripherals by using the
low level SCSI/ATAPI code provided by HDDRIVER. But a special device
driver is needed in any case.

Your supplier is simple shoveling the shit elsewhere if I express
myself in good English.

If it is a no-name disk: do not be surprised when 1 in 10 has a
serious fault!!!

Even good brand names like TDK never manages better then 1 in 200 in
our yearlong use.

IIRC, one of the switch keys (Shift, Alt, or Control) held down when running HDDRUTIL will cause it to use the other language.

But you could also go and fetch the TOS update(s) from http://www.milan-computer.de/html_d/update.html, this contains the setup program msetup.prg which allows you to configure your NVRAM-settings, including the language.

Ciao

Hmm, the very cheap Samsung TV my father bought in 1995 could even
handle NTSC... I have my MSX2 on it...

Oh, and the English version of Metal Gear 2: Solid Snake can be
downloaded from:
Komkon FTP:
ftp://ftp.komkon.org/pub/EMUL8/MSX/Carts/KonamiSolidSnake-Eng.rom.gz
Information about the Translation and ROM/DSK versions:
(Maarten ter Huurne's pages:)
http://www.stack.nl/~mth/msx/solideng/

Glad to be of help! Have fun playing the English version! I finished it,
and it's superb!

CELEBRATE ATARI AT JAGFEST '99

February 26, 1999

ROCHESTER, MN -- Carl Forhan, well-known hobby developer for the Atari Lynx and Jaguar, has agreed to host this year's JagFest event in Rochester, MN, on June 18, 1999. This third annual event will broaden its focus to encompass all Atari systems, from the classic 2600 VCS to the ST line of computers to the Jaguar and everything in between.

"The theme for this year's show is 'Celebrate Atari', and that's exactly what we're going to do," commented Carl Forhan. "I encourage every Atari fan to bring their collection for the 'Rare & Unreleased' exhibit or possibly to trade and sell to other collectors. I know I'll have my 150+ piece collection for the VCS and 7800 present, as well as a number of one-of-a-kind items for the Jaguar and Lynx."

The event will include an exhibit of rare Atari items, tournaments on consoles ranging from 2600 Warlords to Jaguar BattleSphere, prizes for tournament winners and attendees, demos of unreleased games, a trading area for collectors, and opportunities to purchase recent releases for all Atari platforms.

Details are still being worked out, but the projected cost for the event is $10-12 per person. An additional fee may apply to reserve a table for the express purpose of sales.

Be sure to visit the official JagFest '99 website at http://jagfest.atari.org. Carl Forhan may be reached via email at forhan@millcomm.com.

"Suz" wanted to know about the PS3000 Monitor

Suz, if you searched the web like you stated, you didn't look hard enough. I quote directly from my Atari web site:

The PS-3000 was designed for use on the ST series of Atari computers. I'm lucky to have one myself. They are pretty rare. A limited amount of them were sold through the Federated chain of electronics stores shortly after Atari bought Federated. To the best of my knowledge, that is the only place where you could buy them.

The monitor itself was made by JVC. It is a 12 inch monitor capable of displaying low and medium resolution color video.

The floppy drive is a single sided 360k 3-1/2 inch model. It is pretty useless by the standards ot today. The drive is more-or-less the same as the Atari SF354 drive. I'm told that it can be upgraded to the 720k double sided drive, but you will need to do some major hacking to make it work.

Since you don't have a power supply, you will need to find the one that is specific to this model. The power supply for the PS3000 isn't your standatd Atari power supply. I believe Best Electronics sells them for about $90

No as I thought I had made clear the situation is: a simple single-
TOS user wants to connect all 3 his single-TOS TT's.
He does not need multitasking. He wants to go on working as he used
to with only something extra: he needs MiNT because of MiNTNet.
No other reason.
So why N.AES, Multitos MagiC etc?

Luckily there are no special file systems for CD-ROM like Mac, TOS,
MiNT, DOS, VFAT etc.
Putting data files on the CD-R is no problem as long as the writing
software uses and ISO file system (number 9660 as I remember).

Of course: when you put files on it with MAC software or DOS
executables, the de disk is taken as Mac- or DOS-usable.

3558. The HD-Blues

Newsgroup: comp.sys.atari.st
Date: 1999-02-26 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <7b6u5a$s62$4@news2.xs4all.nl>
Source record: 83723

Another story about terrible hardware.
The more of the stuff you have, the more breaks down...

The 500 Mb drive in the DOS-box server broke down. Old age (bearings).
Took him out, server went on (there are more SCSI-drives in there!).

So I manages to get a nearly the same Quantum drive, with als 500 Mb
called ProDrive LPS 525 S (S for second hand?).
In the same deal I became a old doubtable Syquest 44 Mb exchangable
drive.

So what I do: I look at the jumpers of the ProDrive and instal him in
place of the old one in the DOS-box.
Boot... and: working, no problemo!
500 Mb spave thats reads and writes OK after many tests.

Nut now the 44 MB drive. The streamer from the server is broken down
so that 44 Mb exchangable can be used intead.
So Prodrive out, 44 Mb in. Fits beautiful (physically).
testing and: also works.
I am happy.

The comes the next idee:
why not using the Prodive om a TT?
My idee was: the small old Seagate (out of a TT) sitting in a small
box, can be exchanged.
I open the box. Thre is a print containing 2x 25 pins SCSI (in and
out) and a 50 pins flatcable connector to the drive.
I look at that and think: A smell a rat, and then I express myself
decent.
There as an awfull T-split going on! Forbidden according to all
"rules of SCSI". With a terminator and the Seagate I had no trouble:
it worked but I realise: I am lucky, for the same it would not have
worked.

So I put the Prodrive in and drive is seen bij HDDriver but
no more. I realize: it is DOS partioned so simple TOS is a no-go.
I try with HDDriver to do it. It formats and afterwards partitioning
goes in many varying ways wrong depending it seems on the state of
mind of Goddess Electra.

So brewing some lose other parts together (other box, other power
supply, other connector cable) I connect it to a Falcon that has a
totally free SCSI.
I manage to format but when writing after a while the drive and
system freezes with a busy bee and a green continuous LED on the

drive.

Then I remember: that clock-patch for the Falcon SCSI is on the list
of 'things to be done'. And that could be the cause of this freezing.

So up to the other TT with at least a partitioned drive now.

I connect, I test, I read, I write.
No problemo.

And the configuration?

TT with built-in SCSI drive, a flat cable 50 cm long, a 44 Mb
Syquest, a short 25 cm rond cable, a CD-ROM, a 250 cm round cable ,
Epson scanner, 60 cm round cable, the ProDrive, terminator.

And I was always worried about long SCSI-cables!!!!!

Any comment?

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST

Also, be careful how deep you nest the directories using Toast on the Mac and Select DOS compatible. ExtenDos will choke if you nest folders to deep. I think that Roger applied a fix for this, but you just end up using more memory in the end. I'm not sure if Spin for MetaDos have such a limit. Do not write a multi-session disk either. Do it in one whack.

Has anyone used a program called Overlay?
it is listed as a multimedia type of program.
I saw it advertised on the Software-Seidel website.
I assume its only in german, but I would like to knw what it does
in terms of putting things together.

You might want to do something. At Las Vegas (about 400 at show, I think), I was _Looking_ for people I knew from sight and still didn't find them. Guess I didn't look hard enough.

> ...schoene Frauen ????

That reminds me, can someone tell me what "schon" means (Hope I spelled it correctly). NVDI keeps telling me at bootup that certain "Fonte ist schon installert". Don't know if that's good or bad!

For some it does seem so, The Jury hasn't rendered a verdict in my
Falcons case yet ;)

Recently, I have exchanged e-mail with Douglas Little author of Apex
Media. I contacted Doug because I have not received my Apex disks
back, the upgrade or the upgrade fee. Doug seemed concerned over all
the trouble I was having and said that he would e-mail the latest
Apex Media. That was the last I heard from him. He never e-mailed
Apex. But I did enjoy exchanging e-mail with him. He answered alot
of my questions. But raised some others that haven't been
answered. ;)

I do have the 39 page Nemesis manual the cover says 24/48 MHz
system Accelerator for the Atari Falcon 030. Also the small
one page Nemesis Addendum that applies to the 25/50 MHz Nemesis
(which is the one I have) this small addendum covers the DMA Patch,
Buffer Modification which is to remove the 33pf capacitor from
the buffer board. And also the mod to the Nemesis board which is
to remove the two electrolytic capacitors.
Also have the Text file that updates the manual that came from Titans
Web Page. It is dated April 18, 1997. And is 5 pages long when printed
on normal printer paper.

If you have some other docs or instructions, then I could use them
and if they cannot be e-mailed, then I will pay shipping costs.
Can you describe what you have different? ;)

>>
>> I wanted to speak with someone at Titan Designs about the problem

>Per the Nemesis manual, there are some Falcons that cannot be
>accelerated, but hopefully this is not the case with yours. If you have
>the 50 MHz oscillator, the manual addendum states that it will not work
>at all without removing the oscillators.

I think I did see something in the manual about some Falcons can't
be accelerated. I have never seen anything in the manuals about
removing any oscillators. I looked in my manuals again and found
nothing on this. Can you give a page number or something where I
can check this? According to the 25/50mhz nemesis addendum that
came with my package, the two capacitors on the Nemesis board
have to be removed. Which I did prior to the installation.
My Nemesis board does have a 50mhz oscillator.

Which oscillators have to be removed?

I do think my Falcon can be accelerated. I have had no problems
with the Audio or D2D recording at any resolution. I have recorded
megs of samples direct to disk in 640 x 400 in TrueColor mode with
a RGB monitor and 1280 x 960 in 16 colors, 800 x 600 in 256 colors.
With a SVGA, no problems at all. You should see how fast my Expose
digitises color video on a fairly stock falcon. :)

If there is something one can try or look at on a Falcon to determine
if it can or cannot be accelerated, then I would love to know about
it.

>
>I asked David about this, and he explained that the european Falcons
>used all the electronics pictured in that location instead of an
>oscillator, but that in US models all that was replaced by an
>oscillator.

Interesting... Would you happen to know where the oscillator that
replaces all that other stuff is located on a US model Falcon?
And what is the purpose of this oscillator and all that other
stuff in European Falcons?

>
>John

Thanks for you help John, any other info you or anyone else can
give on any of this is appreciated.

SCSI can be a fickle mistress. I've had some unusual problems from time to time including bad cables and drives that just won't get along with each other. The SCSI standard, IIRC, allows for up to 5 meters of cable, and my Falcon actually has 15 feet total (nearly the limit) without problem. Just be careful they are good quality cables -- cheap ones give lots of headaches.

IDE on the other hand is extremely cable sensitive. I believe that standard is something like 1 meter total, though you shouldn't quote me on that.

ScanX Pro certainly exists, I'm using it. I updated to the Pro version
directly through Homa/Nima in November (I believe). Then, in late
December, Nima Emailed me the latest version.

I've always found Nima to be *very* responsive, so hang in there.

The Pro version is a very nice update with improved SCSI and scanner
integration and additional features (which are scanner dependent).

It happened to me. I registered again and it hasn't happened yet.

Let's see, from memory I know I had bin dev usr proc & var. I think just
those 5. I do remember the basic commands, but a lot of secondary commands
are jumbled in there too (pine, vi, ...). I'm hyper busy right now, but I
thank you for your assistance and I'll post back here when I have new news.

Hopefully Nima will update ScanX. I'm not really sure if ScanX Pro already exists -- I emailed today in the hope of finding out. Homa Systems House's web page hasn't been updated in 6 months, so I'm a bit worried. At the Atari Show in Las Vegas last summer, Nima was in pretty good spirits and ScanX Pro was just about ready. I haven't heard from him since, except for his for sale posts recently.

Tim - I have a hotmail account that I access (on occasion when my ISP's mail portal is down) with CAB 2.7 on my TT. The only thing that I cannot do is delete mail from the main page. I must read each one and delete from that page. CAB does not show one little box on the bottom of the page that the PC browsers show. Other than that, it works fine. Can send, spell check etc. I have not tried viewing an attachment so I cannot say, for sure, that works.

I did have on e-mail that CAB would not pick up, but then neither could Opera 3.50, nor NetScape 4 nor EI 4.

Steve:

Thanks for your comments!
I also use cab 2.7 demo with my TT (looks great on my newly fixed 19"
1280x960 monitor!) I found in Hotmail, I can delete only as you said,
but I cannot send. It could be because I have graphics OFF. Or should
I turn on Accept Cookies in Cab?

Yes. CAB 1.5 ;^)

It's best feature is consistant crashing. Any later version (2.0 - 2.7) will
be much more stable, fast, reliable, and much less likely to crash. I used
1.5 for a long time, and almost gave up on ever getting my Falcon on the web.
But once I got 2.5 (commercial verison), it was a whole new world. And now,
I'm eagerly awaiting the arrival of my 2.7 upgrade.

Well apart from the obvious changes, or is Lara Croft just Rick Dangerous
in drag, or worse did Rick have a sex change? These are important
questions that need an answer :-)

Cheers

Not really....MGS was one hell of a game, but Metal Gear and Solid
Snake were 2D birds view games...I would keep that intact, but add
lighting and other effect possible on nextGen machines.....I guess the
3D engine with a 2D look Gremlin Int. used in Loaded would be the
closest to what I have in mind.

Greetz,

Ruud.

Hi Jos,

errmm, wasn't it the Atari Messe Neuss we're talking about?
Looks like you're going to an adjacent Roman Orgy with German Sex Slaves...
:-)

BTW, what happened to your H-U-G-E pile of Atarigear? You didn't all dump
them for a new Milan-060, did you?

Oh, I see what you mean. I downloaded Metal Gear:Solid Snake the other
day on an MSX emulator and it was pretty impressive, although all the
text was in Japanese of course, so I didn't get much of the storyline.

Interestingly (or not) enough, the frequency that Snake talks to the
General in Metal Gear:Solid Snake is exactly the same as that in
Metal Gear Solid.

Is that so amazing? The project supervisor (Hideo Kojima) was still the same guy.....I bet if Hiroyuko Fukui would still be working there there would have been some changes to MGS too....

But anyway, for an 8-bit game Solid Snake is really impressive, the detail levels, the size of the game and of course the brilliant music by Masahiro Ikariko.....and about the Japanese, we 'had' to play a lot of games in Japanese in those days....there is an English version of solid Snake available for the Emulator tho.....dunno exactly where.

Greetz,

Ruud.

ps. I finished Arc the Lad II, Final Fantasy VII and Metal Gear Solid on the PSX too...all in Japanese.....:)

It certainly is an impressive game. Maybe see if I can dig out the
English version from somewhere.

Sadly the MSX never took off on these shores (in the UK), so I didn't
get any exposure to these games back when they were released. I had
a Spectrum, which AFAIK didn't have anything like the stealth'em'up
of the Metal Gear games, although The Great Escape did come close in
parts.

Are you a masochist or something. :)

Unfortunately I've had to wait for the PAL release of Metal Gear Solid,
(seeing as how my TV can't handle 60Hz signals, so I can't play NTSC
games) which means I haven't actually got it yet! (This lunchtime's the
plan, as it's released today.)

3618. NEC D3861 H/Drive problem

Newsgroup: comp.sys.atari.st
Date: 1999-02-27 00:00:00 UTC
From: mike.borsley@zetnet.co.uk
Message-ID: <7b9jjsrkp1@roch.zetnet.co.uk>
Source record: 83554

I recently took an NEC hard drive out of my Mega STE, and slipped up when reconnecting the 50 pin plug to the circuit board. I hadn't realised that there were no edge guides, and refitted the plug, one pair of pins adrift, which has caused problems.

A check on the interface pcb revealed 3 tiny encapsulated fuses, one of which was open circuit. I desolderd this and temporarily connected a 1 amp glass fuse. This brought the drive back into motion, but presumably there is some other damage (beyond my capabilites) as I can't get the drive to boot up.

Does anyone have or know of someone with this h/drive that has given up and may wish to part with the interface pcb? Or alternatively has a complete working D3861 and would consider selling it. I could then fit the interface to my drive, and recover the data. Assuming of course that there is no further damage to the drive.

The pcb is identified as follows :-

PC NEC 16T
With a sticker - G8AHK 24A AAHBG

TIA
Cheers
Mike

ekaljumagi@my-dejanews.com asked politely:

E > could you kindly remind us what the Monitor Master Plus does
E > and what it costs?

Oops. Sorry. I have been messing with it for more than a month now, and forgot that most people haven't. Monitor Master Plus is just a multisync switchbox that I built out of an old Monitor Master. My version retains almost full functionality as a Monitor Master with just the flip of a switch, although you can build yours to just be a Multisync switchbox. ('Almost' - no audio to ST monitors. You need external audio with a M-sync anyway).

What it costs is a Monitor Master and some solder and sweat, plus a few parts. When I said that it is available from me, I was talking about the archive MMPLUS.ZIP, which are the directions and pictures. I don't have access to upload it to an ftp site. I am not planning to build and sell them, even at cost, as my contruction practices in this area are not of professional level.

The ex-Atari dealer here in Boise has two new-in-box Monitor Masters that he will sell for US$31 each. But used ones are advertised in this ng all the time for much less than that.

(Eric - I haven't been able to send email, as something between here and the 'net is truncating your address, which I haven't tracked down yet. But my thoughts are with you :-)

I can't say for sure, but it doesn't appear this problem is strictly an OVL problem. Here, the CABDLOAD module works fine and, yes, I'm using STinG and MagiC (currently ver 6, but it also worked fine with ver 5). Maybe the incompatibility requires some other program to be resident; for example, I run no ACCs here.

Pat & Anna wrote on Sat 27-02-99 13:08 (-0800):

> Maybe the incompatibility requires some other program to be resident; for
> example, I run no ACCs here.

Hmmm I'll try to find the culprit. I use only a few ACCs: xcontrol,
1stguide and st-guide.

BTW, it all works fine with Olivier's ovl and ASH's one (sorry, I always
forget the name of this ovl's author).

Bye,
/Pascal/

3627. Software Serial Port Switcher?

Newsgroup: comp.sys.atari.st
Date: 1999-02-27 00:00:00 UTC
From: Dennis McGuire <sagedm@erie.net>
Message-ID: <Pine.BSI.4.05L.9902272344220.26415-100000@moose.erie.net>
Source record: 83563

I am running a FoReM ST BBS on a Mega STe. FoReM was written back in the days of the single serial port and does not allow an option to change the port. I'd like to be able to take advantage of the higher speed serial port on the Mega STe. Is there a program available that can divert all I/O activity from Modem 1 to Serial 1?

Since you are not getting a proper boot-up from hd, boot from the
floppy: i.e., hold down ALT when you first see the floppy drive's led
flash on then off; let go when it appears again.
You should then get the basic Atari desktop.
Then run AHDI from the floppy, select INSTALL DRIVES from the Menu,
open drive C: and rename the offending ACC to ACX (by clicking on it,
then click INFO from the file menu and type X, ENTER).
Now power down and reboot: you should get a proper boot-up without
the rogue accessory. I hope :)

Cheers,
Charles.

Source record: 83606

Hello everyone,
I have replaced the Trouble Shooting section of MagiC Online with a CAB friendly general purpose message board. Please use it to post your questions regarding MagiC, Anouncements about new MagiC related events/ releases,or just MagiC Talk etc etc. If you have a trouble you need help with, no longer must you email me to put it on the troubleshooting page, just post it and other can reply.
Well, I just stuck up the board about 10 minutes ago so no one has posted to it yet, why not be the first one? :-)

Regards,
Bengy

MagiC Online http://bengy.atari.org

Please note: The huge download section is currently offline as I am having some trouble transfering my archive to atari.org, but I have sent email to the admin and will hopefully be 100% up + new additions very soon.

These are internal timing issues. The Blowup FX allows compensation for
variances, but the Nemesis does not. The Blowup FX manual solicits you
to send your motherboard number if you can't get it to work, but the
responses I received cleared up the problems and I never did get a hint
about the significance of the different motherboard editions.

No not really, the games had similar feel alright but as they were programmed by the same team, it's hardly lifted, how do you nick something from yourself!! Borrowed perhaps, but when the donor is as good as S.blade on the GX4000 I'm not complaining if you can play the same type of game over different mazes and levels.

3645. ATARI Sales, Service & Support! Bravo Sierra Computers!

Newsgroup: comp.sys.atari.st
Date: 1999-02-27 00:00:00 UTC
From: bensmith@user2.teleport.com
Message-ID: <7b8fbtnks1@user2.teleport.com>
Source record: 83612
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,or.forsale,pnw.forsale,rec.games.video.atari,rec.games.video.marketplace

Please direct all replies through E-Mail to bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I do not regularly read NewsGroups.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/ Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

3647. ATW 800 and software

Newsgroup: comp.sys.atari.st
Date: 1999-02-27 00:00:00 UTC
From: prunus@post3.tele.dk
Message-ID: <7b8h5o$50ao$2@news-inn.inet.tele.dk>
Source record: 83614

Is/was there, at anytime, any productivity software for the ATW 800 at all.
I can`t remember I have seen any.

The reason I ask is, that someone have on for sale here in Denmark,
but without software I have no use for it. I know there was a compiler of some kind, but I can`t program the monster, or anyting else for that matter.

I belive it would be a great machine for POV rendering - CAD - or anything in the way of picture manipulation. (movie or fli)

cheers

Joergen

Schon means "already". Fonts have been installed already. Now
"schoen/schoen" is something different: nice, good/goodlooking, neat,
whatever. Schoene Frauen thus means nice ladies. One could start another
discussion on "what is nice?"... :-)

>Thanks, bedankt !

Jos,

first of, check the SCSI ID... is it the same as the old one? If not, you
gotta tick the ID nr. in HDutils and save settings. Maybe one jumper
setting not correct. My personal experiences with IBM drives: once I found
that a drive in a certain physical position in the chain didn't work, at
another one it went OK. You don't need Bigdos AFAIK. Perhaps it needs SCSI
Initiator set... you can activate it in HDutils on ID nr. 7.

HTH,

From: louis@holleman.demon.nl
Message-ID: <36d7da84b4eccdb0@holleman.demon.nl>
Source record: 83622

Hi,

just wondering if there's anyone hooked up to the Internet by means of a cable connection... using Atari's. I know several people using PC's, but what's the word on Atari?
Since I'm spending around 75-100 USD on my phonebills monthly just for net access (plus the ISP fee) a cable connection probably is cheaper for me. We don't have those facilities in my place yet, but I reckon it won't take long before we do.

No I do not {:-)

When asked I tell them: 25 cm and with much luck 40 but do not count
on it.
Sometimes people think that it is a good idee to buy a cheap IDE
drive extra for their Falcon, put it in a box and use a lot of
flatcable for connection.

I remember there was lately something about IBM drives. Was it not
Louis ?
He did not get the drive working because it was 'differential SCSI',
electric diffrent from our kind of SCSI.

The first question is: is there any movement in the drive?
Spin up?
LED-lighting?
kr, kr, tic tac noise?

If so: configure HD Driver for unit attention, bus arbitration and
give the computer a SCSI-ID.

Because the AES in TOS runs in supervisor-mode a lot, use a lot of busy waiting and generally doesn't work well under a multitasking kernel.

>White Flame (aka David Holz)
>http://fly.to/theflame

You do ? Well....first of all, the in-game Lara Craft is not a 3D
model, it has been modeled but the in game Lara is a polygon based
sprite....(there is that word again). But you are right, in a lot of
times the word sprite is inapropriate.....objects would be a better
word, but since a lot of ppl in bussiness now also worked on those
nice 8-bit thingies like the MSX or C64 where all moving objects WERE
sprites.....guess you just keep referring to that word....

Now we COULD start a brand new discussion here about using names like
spites, objects and so on....but what the heck....you got the meaning
didn't ya ?

Hmm, but surely the coding was so damn similar, Gremlin must have been
a little narked at it being practically re-used in the Codies game?
Also, I found Stryker to be vastly inferior to Switchblade, although it
used colour better, that's for sure.

3669. Re: CAB 2.7 & ScanX

Newsgroup: comp.sys.atari.st
Date: 1999-02-27 00:00:00 UTC
From: Nima Montaser <nima@canada.com>
Message-ID: <36D7FD20.EE3DD2F@canada.com>
Source record: 83636

Hi Paul,
ScanX supports the following scanners:
Microtek: E3/E6/E3+/E6+/E330/E630/V300/V310 and should work with the
new X6. All scanners must be SCSI.
UMAX: Astra 1220S/1200S (and some older models)

In terms of price and performance, I recommend the UMAX ASTRA 1220S and
the
ScanX PRO version of ScanX.

ScanX comes in two flavours: Regular and PRO. The PRO version has
many more features and is the version that will have future additional
features.

Please make sure to visit our website for more detail. The site
was updated yesterday.

If you have any questions, please don't hesitate to contact me.

Best regards,
Nima Montaser

Hi everybody,
I would like to announce that Homa Systems House has just updated
their Web site, for those who are interested.

We are announcing new product upgrades and releases in this updated
site. If you don't have access to WWW, please let me know and I
will email you the information.

The website address is:
http://www.magma.ca/~nima

Best regards,
Nima Montaser

3671. ScanX PRO is available

Newsgroup: comp.sys.atari.st
Date: 1999-02-27 00:00:00 UTC
From: Nima Montaser <nima@canada.com>
Message-ID: <36D7FEBF.A7EBB495@canada.com>
Source record: 83638

Hi,
ScanX PRO, the professional edition of UMAX and Microtek scanning
application from Homa Systems House is available.
It adds the following features, over and top of the existing features
in ScanX (regular):

-Zooming on Prescans (Magnifying glass Button): 1X through 8X
zooming is possible
-Printing and Photocopying (Printer Button)
-Page Select pop up
- Gamma Correction: You can set GAMMA values from 0.1 to 9.9.
- Adjustments to Prescan: You can now adjust
brightness/Contrast/Gamma values and
view them one prescan.
- Brightness/Contrast adjustments for UMAX scanners (through
software!)
- UMAX Astra transparency adaptor scanning
- Combined UMAX and Microtek compatibility
- New look and feel: Color Icons representing scanning features
- TIFF/TGA saving of color/grayscale images
- Many internal changes and enhancements
- Image resizing (intrapolation, scanning upto 1200dpi) will be
added in the next release of ScanX PRO, due in Q2 of 1999.

For more information, please contact us at: homa@canada.com
Make sure to visit our webpage (it was updated yesterday) as well
for more detail on our products.

But sprites were so-called because they 'floated' across the screen
without interfering with the background. Lara is bitmapped onto the screen
by the program. With sprites you could just say 'move LARA' and the
mapping would be perform at broadcast time by the video circuit. Lara does
a 'move LARA', 'redraw SCREEN', [broadcast].

SO why did you think I said that often enough the term sprite is not
apropriate, of course Lara is bitmapped, like with every PC game the
moving things are bitmapped.....nevertheless because they are USED and
BEHAVE like sprites we all still call em that.......call me
sentimental ;)

SS tttttt eeee ll ll aaaa
SSSS tt ee ee ll ll aa
SS tt eeeeee ll ll aaaaa -- "An Atari 2600 VCS Emulator"
SS SS tt ee ll ll aa aa
SSSS ttt eeeee llll llll aaaaa

================================================================================
Release 1.1 for DOS, Linux, and Unix
================================================================================

The Atari 2600 Video Computer System (VCS), introduced in 1977, was the most
popular home video game system of the early 1980's. Now you can enjoy all of
your favorite Atari 2600 games on your PC thanks to Stella!

Stella is a multi-platform Atari 2600 VCS emulator written in C++. Stella
allows you to play most of the games written for the Atari 2600 including
Supercharger games.

This is the 1.1 release of Stella for DOS, Linux, and Unix. Distributions
for other operating systems will appear as they become available. The three
distributions currently available are:

* Binary distribution for Linux (stella-1.1-linux-x86.tar.gz)

* Binary distribution for DOS (st11.zip)

* Source code distribution for Unix and DOS (stella-1.1-src.tar.gz)

A few 2600 ROM images, BIN files, are included with these distributions.
BEYOND THESE FILES NONE OF THE DISTRIBUTIONS CONTAIN ANY 2600 ROM IMAGES.
PLEASE DON'T WRITE ASKING FOR ROMS BECAUSE THEY ARE COPYRIGHTED! If you
own any of the Atari 2600 Action Packs by Activision you can use the ROM
images from them with Stella.

New in this Release
==================

* DOS and Linux versions support real Atari 2600 paddles using a
special PC game port adaptor

* Linux version uses the new 1.2.x joystick driver API

* Added support for the "-display" option to the X Window version

* Added support for private colormaps to the X Window version
```

* Fixed a few bugs in the Supercharger emulation

- A major bug in the ROM loading routine was fixed

- Multi-loading in "Escape from the Mindmaster" works correctly

- All Supercharger games load and execute at this point

* Added a small hack to the TIA code to fix a display problem in "Escape from the Mindmaster"

* Improved TIA emulation to support the RESPx multi-sprite trick

Distribution Site
=================

The Stella distributions can be obtained from the Stella home page at:

http://stella.atari.org

If for some reason you are unable to connect to this page please try again later or try http://www4.ncsu.edu/~bwmott/2600/.

Spin! can read ISO-9660, Joliet and HFS (as well as a few others I can't remember), so if you want to write CDs that's compatible with both MacOS and TOS/MiNT/MagiC then just make HFS-Cds. The Mac is rather braindead when it comes to CDs, it can read HFS and ISO-9660, but that's about it. ISO-9660 is not really suited for Macs (8+3 filenames, you'll lose the resource-forks), and if you use MiNT or MagiC with VFAT or MinixFS there's also long (casesensitive/preserving) filenames on the Atari.

How much memory do you have? If your Mach32 has only 1Mb then 1152x864 will use
995328 bytes, while 1280x960 will use 1228800 bytes.

Someone will answer your last question, I hope. I have the problem
with Everest, which frequently declares it will truncate long lines
(like the above) and convert nulls to zeroes: in which case I cancel
the message I was about to write. Have I missed some parameter changes
I should make in Everest?

Cheers,
Charles.

3684. Software Serial Port Swit

Dennis McGuire <sagedm@erie.net> asked politely:

S > Is there a program available that can divert all I/O activity
S > from Modem 1 to Serial 1?

I use several apps that think that Modem 1 is all there is. I just use Peter R.'s Serial Port Setter cpx, and everything (so far) gets the message.

btw, does anybody know how to save this serial port cpx setting so it stays at Serial 2 (or whatever) after a reboot? I am sure that it is just my ignorance that I have to keep re-setting it to Serial 2.

3688. FS: Winnipeg Atari ST User Group fundraiser blowout! everything reduced

Newsgroup: comp.sys.atari.st
Date: 1999-02-28 00:00:00 UTC
From: trevor@cyberspc.mb.ca
Message-ID: <7bajfjghj1@canopus.cc.umanitoba.ca>
Source record: 83455

GIANT ATARI ST HARDWARE / SOFTWARE / MAGAZINE / BOOK BLOWOUT!

Yes, our sale is still happening! All prices knocked down another notch. Check it out!

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

Please look through our list and pick out something you can provide a good home to. All hardware/software is fully guarenteed for 2 weeks from receipt. Everything comes with full email tech support from a knowledgable STUG member, we'll try our best to help you out!

If you want a whole bunch of stuff, discounts are available. Let us know what you think is a fair price. We just want good homes for all this STuff!

Every item purchased includes an issue of the STUG Chronicles (our newsletter) FREE!

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly.

Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President
trevor@cyberspc.mb.ca

EPYX World Games - challenge yourself or a friend in different events! $3
disk/docs =

Accolade Test Drive $7
disk/docs =

Test Drive II - the duel, European challenge addon, the supercars addon $3
great car racing game with 2 bonus packs of cars! 4 disks
disk =

Dungeon Master - includes Secrets of Dungeon Mastery book $3
considered by some to be the best ST RPG game ever!
disk/docs =

Le Livre du Graphisme $3
disk -

Word Writer ST - a fast easy to use word processing system $5
from Timeworks that can interface with their Spreadsheet & DB
disk/docs/box -

Image Cat - complete graphics cataloging system for all Atari ST computers $3
disk/docs -

Le Livre de 1st Word Plus - formation, exemples et applications $3
a book in French, 200 pages hardcover, looks at 1st Word processor
in depth, mint condition, comes with disks

GramSlam - grammar and style checker, checks for 1200 errors, $3
can run as an ACC or PRG, works with all word processors
disk/docs -

OSS Personal Pascal v2 $10
disk/docs `

OSS Personal Pascal v1.02 $5
disk/docs `

Dr.T's Roland D-50 Editor/Libr $29
disk/docs `

Roland D-50 Synthesizer $592
great condition classic synth, $199 price drop!! `
includes the above software and some patch files

Leisure Suit Larry 2(?) Looking for Love... $5
disk/docs/box classic sleazy fun w/pixelated nudity by Sierra `

Universal Military Sim (UMS) $3
disk/docs/box looks great especially in mono `

Warp9 - speed up the graphics on all TOS machines lots! $15
disk/docs `

STalker 3 - best telecomm modem software $20
disk/docs/box `

STeno 2 - best text editor works great with STalker $12
disk/docs `

Improve Your Golf Game w/ Richard Zokol - VHS NTSC video; brand new; $4
shrinkwrapped, approx 30 mins

PC Guide to Connectivity - Networking book for PC's ZiffDavis 470p $25
BOOK mint condition 1995

Word for Word disk+dox - crossword puzzle creator $3,

Assempro disk+dox - assembly language compiler $3,

E-z calc disk+dox - good spreadsheet $3,

Megatraveller disk b only+dox - game; missing disk A it would seem $2,

Neodesk v2.0 disk only - might be upgradable $3,
the famous desktop replacement

Advanced art studio disk only - paint program from Rainbird $3,

EKG teaching disk only - By mad scientist software - educational $3,
EKG parts/ rhythms and pathology recognition

Fleet street pub v1.0 disk only - 3 disk set - top notch DTP program $3,

Universal item selector v1.0 disk only - the best file selector replacement $2,

Sim City disk only - very addictive simulation game - needs manual $2,

Pipe dream disk only - game; may need a manual for copy protection $2,
by lucasfilm, so you know it's good!

Night shift 2disks disk only - game; may need a manual for copy protection $2,
by lucasfilm, so you know it's good!

Omega disk only - strategy game by Origin $3,

Red storm rising disk only - submarine simulation 2disks $3,
one of the best realtime strategy sim games for the Atari!
amazing sim of realtime submarine combat

M1 Tank platoon - amazing tank sim game; this pack comes with the Atari $9
AND DOS/PC versions on floppy as well as the famous heavy MPS manual;
the PC version will run on ANY old PC, even 286 & earlier;
disk/docs/box

Balance of power disk only - strategy game; manual needed $3,

Crack'ed disk only - game published by Atari $3,

Z-ram diagnostics disk only - v1.1 for use with Z-Ram RAM upgrades $2,

Aegis animator disk only - animation generator and viewer $3,

Dac easy accounting disk only - accounting software 2disk $3,

All four Lexicor paint/rend/ani software packages below for only $29, !!!!

Prism paint v1.5b disk only - 4disks - top notch paint program $13,

Prism render tt030 disk only - v1.03 top notch rendering program $14,

Chronos keyframe animator tt030 v1.3 - disk only - amazing animator for TT $16,

Chronos keyframe animator v1.3 3disks - disk only - amazing animator $16,

Cyber studio set - hundreds of dollars of great CAD/paint/render software!
cyber paint v2.1, cyber mate v1.1, stereo cad-3d v2.02,
cad-3d, plotter & drivers, human design disk, cartoon design disk,
cyber control - disks only $22,

Space quest 3 hint book (book only) $3,

GFA Basic Manual - appears to cover v3.0 and 3.5 and compiler 3.0 $5
book only

Michtron gfa basic version unknown, 3 ring binder (book only) $3,

Michtron bbs v3.0 (book only) $2,

Macro Mouse by Antic disk only $4 `

Migraph drawing utilities set - includes TouchUp, MergeIt and Scan&Save
disks only, manual for mergeit $8 `

SwiftCalc ST by Timeworks - great spreadsheet with graphing 2disks
disk only $9 `

Word Writer ST by Timeworks - great graphical wordprocessor
disk only $3 `

Interlink ST - packaging/box only (no disk, no manual), beautfiul $3
black plastic videotape style box with the company logo all
over; slides into a white Interlink box

Windows Internet Tour Guide BOOK - 344p softcover, includes CD-ROM with $8 s
everything you need to get a PC on the net with Windows 3.x,
have an old 2/3/486 lying around? get it on the net the easy way!

==========
HARDWARE
==========

Citizen GSX-130 COLOR dot matrix 24-pin printer, great condition $50
This is an older model and many popular Atari programs should have
drivers for it. Works on PC's too! Decent quality output, and
the ribbon has a fair bit of life left in it.

SyQuest EZ-Flyer 230MB SCSI external removable hard drive w/1 cart $88 h
Perfect for a Falcon or TT with a SCSI port or any other ST with an
ICD Link or other host adapter.
This is the great little 3.5" SyQuest disk system that holds 230MB
per cartridge. It can read and write the older 135MB cartridges also!
It is in a rugged and cool-looking external portable case. It is a
quick and cheap way to add a hard disk or unlimited removable storage
to any system.
It comes with the A/C adapter, SCSI cable (depending on what kind you
require, email for info), one 230MB cartridge disk and the drive
itself. Everything is in perfect working order and there are no bad
sectors on the cartridge. It is guarenteed to work for 2 weeks after
receipt. Includes FREE shipping in cont USA/Canada!!!!!

SyQuest 88MB cartridges only $33/each or 5 for $125 h

Printer support stand - 2 plastic legs designed to hold the printer $5 h
up over the paper which goes underneath. Works best with larger
dot matrix printers and continuous feed paper. Sturdy smokey-clear
plastic and rubber pads to support the printer.

Chinon CDS-435 SCSI CD-ROM drive 1X - was working fine but one $12 h
day stopped accepting disks (it just ejects them);
this drive has had the ROM upgrade to make it more compatible
with other computers

CapeTronic 1200 baud external modem w/builtin A/C adapter & vol control $11 h.
great starter modem for an ST or 8-bit; includes phone cable;
serial cable for ST/TT available for only 5 bucks more

Packard Bell 1200 baud external modem $10 h
great starter modem for an ST or 8-bit; includes phone cable
and A/C adapter; serial cable for ST/TT available for 5 bucks more

Atari 1200 baud external modem - classic modem $11 h.
great starter modem for an ST or 8-bit; includes phone cable
and A/C adapter; serial cable for ST/TT available for 5 bucks more

GVC 2400 baud external "super modem" with full manual $18 h-
great starter modem for an ST or 8-bit; includes phone cable
and A/C adapter; serial cable for ST/TT available for 5 bucks more

100 watt PMPO Power-Link PL-100 A/C powered 3D speakers w/3" cone $11 h
Plugs right into any Falcon/STe/TT (may need minijack to RCA converter
from RadioShack for a couple of bucks)

Pengo 25-pin data switchbox (2 to 1) for modems or printers $11 h.

5.25" floppy drive mech, stopped working recently, perhaps revivable $4 h`

Mouse pad by Moustrak Inc. - grey $3 h=

Modem/serial/printer cable 25 male to 25 male Dsub approx 5' $6 h

Original Atari mouse, guarenteed working $13 .

ST/IME internal clock/calendar from Zubair Interfaces Inc, sets your $19 .
clock automatically every time you boot. Includes box,
software and hardware. Suggested retail was $58.95. Brand new.
No guarentee on lithium battery (estimated 10 year lifespan)

Atari ST VT-100 emulator cartridge, weird antique cartridge from way $9 .
back when. For the hardware collector buff. Plug it in and
boot your ST and up pops a TOS-based terminal program!

Syquest 44MB removeable hard drive w/1 cartridge $73 .
in 2-bay (1 bay free) "shoe box" style external case including
host adapter so you can hook this drive directly up to any
ST without an expensive ICD Link. The case has a DMA thru
connector so you can still hookup your SLM or another drive.
Includes DMA cable and software. Everything you need to get going!

Syquest 44MB cartridge $28 each; 3 or more $20 each

Monitor Master, switch between color & mono with a flick of a button! $4 =

Golden Image optical mouse - no ball, super light, amazing mouse! $3 `
minorly broken, button sometimes works and sometimes doesn't,
and it often doesn't want to move right; comes with special
gridded mouse pad

Atari SC1224 RGB Color Monitor $35
docs =

Atari SC1224 RGB Color Monitor - minor problem: the power button switch $20
won't stay pushed in unless you hold it; fix or replace with a
switch from Radio Shack; otherwise works perfect with great picture
docs =

Spectre GCR - the premiere Macintosh emulator - complete and upgraded! $32 =
disk/docs/cable =

Epyx hand conformed joystick $3 =

3 1/2" Oceanic America Master-3S external floppy drive $36 =

3 1/2" external floppy drive - unbranded, sturdy slim metal case $30 -
with floppy cable and power supply

Atari 3 1/2" external floppy drive; flakey - reads ok sometimes $19 -
but most of the time doesn't; perhaps fixable; sold as-is
with a working power supply and floppy port cable

Epyx 500XJ joystick - minorly broken, probably fixable or usable for parts $2 `

Atari Mega STe computer 16Mhz 4MB RAM, 300MB+ hard drive $289
HUGE PRICE REDUCTION - was $414!
Now with both a working keyboard and a keyboard with a couple
of broken keys (for spare parts), and also now with 4MB instead of 2!
Great computer with BIG hard drive.

Atari 520 STf $21 .
no floppy disk drive; includes power supply; add 5 bucks for a mouse

Atari 520 STf $44 .
with DS disk external drive; add 5 bucks for a mouse

Atari 520 STfm $24 .
dead internal power supply (looks like it melted down);
probably repairable or certainly usable for parts; this is the
model with internal DSDD floppy drive and TV output

External Power Supply for the Atari 520 ST $19 .

Atari 1040 STf bare $69 .
add 5 bucks for a mouse, 1 buck for a manual, 1 buck for a power cord

Atari 1040 STf bare, needs repair: slight wobble in picture output $34 .
and internal floppy drive is dead, everything else appears fine;
fix or use for parts;
add 5 bucks for a mouse, 1 buck for a manual, 1 buck for a power cord

Atari 1040 STfm $77 .

Atari external floppy drive $27 .

Atari Color monitor $43 .

Atari Mono monitor $33 .

2 Wico hand-formed joysticks $3 -
1 in perfect condition; 1 sticks a little

"IBM Services" mouse mat; attractive plastic over foam base $4 h

==========

Well, since you can find STs for under $100 usually $50 and Falcons can be had anywheres from $350 to $650 in North American, I suggest you either
a) buy only an ST and save alot of money, and have fun checking out the demos and maybe try to do one yourself.
b) Spend the extra money and get a Falcon, and spit up the extra money for the ST as well. (Who cares about deskspace.) Anyways people even give away STs.

I myself have both. You won't be dissappointed and there is alot of help here.

I am using CAB 1.5, Have been for about 1 year. I remember it crashing when I first started using it. But I believe 90% of it was me. I use TOS 1.0 and certain functions had to be comprimised.

I have few problems with 1.5 although I use an OLDER overlay. I am currently using 1.2805.

Make certain you have VJC turned off in STing. Check out you CACHE for any suspect files. Zero bytes ect. Also if you are crashing ALOT DELETE the CACHE and start again.

I don't use CAB 1.5 for Email (inconvenient) but I use NEWsie instead. If you have newer OS you will want to combine them.

I run Graphics on and use OUTLINE fonts (TRUE TYPE) and have No problems. I do have to be careful of the 40FOLDER bug with TOS<1.04.

Also, while CAB 1.5 has a trick that makes it able to work on Frame sites, (Some places you see just how useless part of the frame is as it says advert.htm:-) and you can select each section of the frame to view one at a time. However I have discovered that some frame based pages, no longer work as they use different commands to the selected pages that 1.5 doesn't handle). Oh BIKENET what a crapper, since I used to go there with no problems.

Anyways, you can always try the CAB 2.7 demo and see how that works. And someone can tell me where to find it:-).

Later Brian.

3695. Re: CAB Mailto: NEWSIE crash

In Single TOS you may be running out of memory with both applications
and then the editor. Thus 3 applications in all. Especially with only
a 1040. Although I don't have CAB 2.7 I thought it required nearly 2meg
and NEWsie requires nearly 1 meg. Plus whatever your editor has.

On 27 Feb 1999 13:53:34 , Martin Tarenskeen wrote:

When you say the BEST, you will get different answers, so I will tell
you what I use on my ST.

FTP= NEWsie
Also does email, and NEWs, + rudimentary browser.
However there are more flexible ftp programs available.

Telnet: I use Peters Telnet that can be found on his homepage. That is
the STing author. I am assuming you are using STing with CAB and
not Iconnect.

Sound and Video: I would recommend MP_STE for AVIs,MOV and QT. Great if you
are into South Park, even works on my MONO ST.
If you want MPEG, you will have to USE 1ST guide, which does a multitude
of functions. Sound, MPEGs and JPEGS. Also a good sound player is NPLAYER.
I just downloaded it and it works very well.
If you are in North America, you can register MP_STE with HOMA SYSTEMS.
I believe MP_STE is at version 2.81 for the ST/e.
MPlayer for the 68030 is at version 2.99 and now does Mpegs. Perhaps the
ST may soon be able to do MPEGS with a little more speed.

Hope this helps for the time being.
What version of CAB will you be using?
Later Brian.

Can someone explain to me what this HORRIBLE little program does, besides cause my ST to crash? It came with Magic and I see other programs require it. What does it do? And is there a program that does the same thing but is MORE reliable. I at first thought my problems were just a very unstable version of Magic. However after disabling WDialog, the crashing has been reduced to a minimum. Also is this program public domain? I have version 1.4 and I hear there is a verson 2.0?

Sorry for my confusion.

Brian.

3698. Re: Creating an Atari CD on a Mac?

HT> In other words, ISO-9660?
HT> Yes, I think this guy uses "Toast" on his Mac.

I use Toast on my Mac - maybe I can clear up some questions...

HT> How deep is too deep? How many subdirectories are safe?

Okay, first and foremost, you need to decide whether you want a disk
that will function on both the Mac and the Atari (or MagicMac) with
all the bells and whistles - or do you want a simple backup of Atari
data that can be read on any Atari system.

In order to be the most compatible with the Atari system, I'd suggest
that you write an ISO 9660 Level 1 disk (the most primitive). The
limitation here is eight levels of nested directories. Toast will
warn you if you try to write an ISO 9660 Level 1 with any files nested
any deeper than this. You must conform to the 8.3 file/folder naming
convention: only letters A - Z, numbers 0 - 9 and the underscore. No
other characters are allowed.

There is a possibility that ExtenDos might choke on a file path\name
that is too long - that is, when you include the nested folder names
as in,

MYCDDISK\IMAGES_1\JPEGS_45\LOGOS_32\YADDA\YADDA2\BLAH\BLAH2\MYLOGO56.JPG.

I'd suggest that you have a look at some commercial CDs on your Atari
system and see where ExtenDos begins to have difficulty. I know that
I occasionally have trouble with some of the Suzy B CDs when we get
too far down into nested folders.

When you are actually setting this up in Toast, you will be given some
options to expand on the above, "Allow MS DOS names" expands the range
of characters allowed in file names to include special characters such
as ()@-^!$%&{}'`#~. Don't do this unless you really, really have a
burning need to have what the Atari system would call illegal
characters in your file names.

"Joliet" is the long file name convention used for Windoze. The less
said the better.

"Allow Macintosh Names" allows you to write your files just as they
are on the Mac. I'm not sure when you'd really want to do this, but
you COULD write a 9660 disk that your Mac can read, and still see the

Mac file names... I don't think that the Atari would like that, however. This is because the Mac uses the Creator and Type codes that are written in each data and executable file, whereas DOS and TOS rely on the file name extension (.PRG or .TXT, etc.) to determine their use. Just stick with the TOS naming rules and you should be alright.

One setting that might be useful is the "Use Apple Extensions" option, which writes the Mac data and resource forks for each file. This should have no effect when viewed from a PC or Atari, but will allow the Mac to see each file as it would normally.

HT> > Do not write a multi-session disk either. Do it in one whack.

Toast lets you write "Sessions", which works like writing one CD that doesn't take up all the available space on the disk, and then later writing an additional disk that uses the unused space. You can write two sessions of differing types, such as a Mac session and an ISO 9660 session. This gives you what is called a "Hybrid" disk. Since the Mac can read multiple sessions (provided you have the appropriate extension loaded in your System folder), you should be able to see both sessions. The Atari will see the ISO 9660 session only, and only if it is the last session written to the disk.

If you want to get fancy, read the section on creating a Mac/ISO hybrid disk in the Toast manual starting on page 6-32 (in particular read the section on "Why writing Hybrid disks is a Bad Idea"). You'll see that there are very particular formating issues in setting up for this, particularly in the block size of the source hard drive. Generally, this is a huge pain in the butt.

HOWEVER, in the spirit of keeping it simple, just write a simple ISO 9660 Level 1, single session disk that any Atari would be pleased with, and you'll be happier in the long run.

HT> I should ask this guy with the CD writer to make a CD just as he would
HT> make a Macintosh CD, but use the ISO-9660 format instead.

Well, yeah, sorta... The procedure is very similar, provided you have prepared your source data so that it follows the ISO 9660 Level 1 restrictions. Wouldn't hurt to have a squint at what the Toast manual has to say about writing ISO disks, starting on page 4-17.

HT> -NOT multisession!

Not unless you get ambitious. For now, you probably just want a simple backup, so don't show off. From the sounds of things, this won't be an issue for you anyway, since you will be writing so much data that there wouldn't be sufficient room for another session. Writing the complete disk "closes" the disk, making it readable on a variety of systems.

HT> -I should take care not to make too many subdirectories when preparing
HT> the harddisk

Use your best judgement, but the limitation here is ExtenDos, not the disk writing process per se. I know that ExtenDos occasionally gets the hiccups when I burrow too deep into my Suzy B's CDs, which often have stuff four and five folders deep. I'd test out what you are going to be using in Atari-land to read this disk, as that is where you are going to find limitations.

HT> As for the name of the CD itself, he tells me that I should make a
HT> folder where the name (and icon) makes the name/icon that shows up as
HT> the CD, when on the Mac desktop.
HT> How does this apply to the ST?
